Citation: Mainstream Aquatics Ltd. 2009. Site C fisheries studies – Juvenile fish use and habitat inventory of Peace River tributaries in summer 2008. Prepared for B.C. Hydro. Report No. 08008CF: 78 p. + Appendices.

## **EXECUTIVE SUMMARY**

B.C. Hydro is presently considering the Peace River Site C hydroelectric project (Site C) in north eastern British Columbia as a potential resource option to help meet BC's future electricity needs. Tributary fisheries studies are presently underway to add to existing baseline information and to address data gaps that have been identified.

The objectives of the study were to measure water temperature and discharge, determine species composition, distribution and relative abundance of juvenile fish, and to identify rearing habitats in Peace River tributaries within the Site C study area. The study area included Maurice Creek, Lynx Creek, Farrell Creek, Halfway River, Cache Creek, Red Creek (at tributary to Cache Creek), Wilder Creek, and Moberly River. The survey was completed during a 10-day period from 29 July to 7 August, 2008 with discharge and water temperature monitored between 17 May and 26 October, 2008.

### Water Temperature and Discharge

Water temperatures were high in the small tributaries during the summer period ( $>18^{\circ}\text{C}$ ) and daily temperatures varied by as much as  $10^{\circ}\text{C}$ . Water temperatures exceeded the cold-water fish species critical tolerance threshold of  $22^{\circ}\text{C}$  in Maurice Creek, Farrell Creek, Cache Creek, and the Moberly River. Lower water temperatures were recorded in the Halfway River during the summer period ( $15^{\circ}\text{C}$ )

Discharge was at or near base flows in all sampled tributaries at the time of the survey. Surface water flows on small tributaries were less than  $0.02 \text{ m}^3/\text{s}$ . During late summer, discharge of the Moberly River was  $3.5 \text{ m}^3/\text{s}$  and discharge of the Halfway River was  $48 \text{ m}^3/\text{s}$ .

### Fish Habitat

The survey identified three dominant juvenile fish habitats in all study tributaries -- Pools, Riffles, and Runs (or Glides) suggesting a consistent, uniform distribution of habitats. In addition, juvenile fish habitats were similar in the Upper Section and Lower Section of each study tributary.

### Fish Composition, Relative Abundance and Distribution

In total, 20 fish species were recorded during the study. There was representation by sportfish (6 species), suckers (3 species), minnows/trout-perch (8 species), and sculpins (3 species). In most small tributaries minnows and suckers dominated the catch. Mountain whitefish was the only sportfish species that was widely distributed. Arctic grayling and burbot were recorded only in the Moberly River and the Halfway River, while rainbow trout were considered numerous only in Maurice Creek. Prickly and

slimy sculpins were present in most tributaries, but were numerous only in Maurice Creek, Halfway River, and Moberly River.

The number of recorded species increased with tributary size, but the species assemblages were generally similar among Upper and Lower sections of each tributary. One exception to this finding was on Maurice Creek where rainbow trout were three times as numerous in the Upper Section compared to the Lower Section.

Young (Age 0 fish and Age 1 fish) sportfish were present in a number of tributaries. Maurice Creek, Farrell Creek, and Lynx Creek contained young rainbow trout suggesting that all three tributaries provided rearing habitat for this species. Very high numbers of Age 0 rainbow trout were recorded in the Upper Section of Maurice Creek. Young Arctic grayling were recorded in the Upper Section of the Halfway River and in the Lower and Upper sections of the Moberly River. Young mountain whitefish were recorded in Upper and Lower sections of the Halfway River and Moberly River, but were scarce in the small tributaries. Age 1 burbot were widespread in Upper and Lower Sections of the Moberly River, but were largely absent from other tributaries.

### Conclusions

Environmental characteristics of the study tributaries influenced the availability and quality of juvenile fish habitats and likely explained the fish community that was recorded in each stream. High summer water temperatures in the small tributaries probably limited use by cold-water fish species. Low flows in all small streams during the study reduced the availability and quantity of juvenile fish habitat. Physical characteristics of fish habitats were generally similar among study tributaries and among sections within tributaries. Habitats were dominated by Riffle-Pool-Run complexes and bed materials were dominated by Pebbles/Gravels and Cobbles.

Twenty fish species were recorded during the study, which represented several groups including sportfish, suckers, minnows/trout-perch, and sculpins. In general, the numerical importance of a particular species varied between tributaries, but the species assemblage did not vary substantially between sections within a tributary.

Of note were the following:

- Suckers and minnows are the numerically dominant groups in most tributaries
- Sculpins are widely distributed in the study tributaries
- Juvenile bull trout do not use the inventoried sections of the study tributaries
- Maurice Creek, and to a lesser extent Lynx Creek and Farrell Creek, provided habitat for juvenile rainbow trout
- Young Arctic grayling were recorded only in the Moberly River and the Halfway River
- Substantial numbers of young burbot were recorded in the Moberly River
- Few young mountain whitefish were recorded in the small tributaries

Overall, the program provided good information and the findings were consistent with previous studies. The cumulative data set from the present and previous investigations adequately describes baseline conditions within sampled sections of the study tributaries over multiple years.

## **ACKNOWLEDGEMENTS**

The author would like to thank Bruce Mattock and Hugh Smith of BC Hydro for initiating the study and providing input to the study design and report review. Jack Matches of B.C. Hydro supplied the study area base maps. Our thanks also go to Rachel Keeler of AMEC Earth & Environmental for providing information describing previous fisheries investigations.

The following Mainstream Aquatics Ltd. personnel participated in the program:

Richard Pattenden	Senior Biologist and primary author
Derek Gastle	Biological Technician and contributing author
Todd Sherstone	Field Biologist
Dave Winarski	Field Biologist
Chantal Pattenden	Biological Technician
Lindsay West	Biological Technician
Jason Calvert	Biological Technician
Jessica Parker	Biological Technician
Scott Taylor	Biological Technician
Shannon Green	Biological Technician

## **1.0 INTRODUCTION**

### **1.1 BACKGROUND**

B.C. Hydro is presently considering the Peace River Site C hydroelectric project (Site C) in north eastern British Columbia as a potential resource option to help meet BC's future electricity needs. Fisheries studies are presently underway to add to existing baseline information and to address data gaps that have been identified. Investigations were completed in 2005 and 2006 that described fish use and habitat characteristics of Peace River tributaries. The scope of the 2005 work was, in part, to conduct detailed habitat and fish surveys in the tributaries that would be affected by the Site C dam (AMEC & LGL 2006). The 2006 work was, in part, designed to add to the baseline data collected in 2005. An additional objective was to identify the location and to characterize critical rearing habitats in tributaries upstream of the proposed Site C dam (AMEC and LGL 2007). The 2005 and 2006 work documented seasonal flow and temperature regimes, fish species composition, abundance, distribution, and general population characteristics as well as providing a description of fish habitats.

In 2008, Mainstream Aquatics Ltd. was contracted by B.C. Hydro to continue those investigations. Three studies were completed on Peace River tributaries in 2008. They included an assessment of fish use of tributaries in spring and fall, a juvenile fish and habitat survey in summer, and enumeration of bull trout spawners and redds. This report summarizes the results of the juvenile fish and habitat survey in summer.

### **1.2 PURPOSE AND OBJECTIVES**

The purpose of the study was to collect baseline fisheries information to describe juvenile fish use and habitat characteristics of selected Peace River tributaries, with the intent being to add to the existing database.

The objectives of the study were as follows:

1. Measure water temperature and discharge in study tributaries.
2. Determine the species composition, distribution and relative abundance of juvenile fish in areas upstream and downstream of the Site C reservoir inundation level.
3. Identify and characterize juvenile fish rearing habitats upstream and downstream of the Site C reservoir inundation level, with emphasis on critical habitats.

### **1.3 STUDY AREA**

The study area included eight tributaries of the Peace River located upstream of the proposed Site C Dam location. The study area was delineated based on requirements of the Terms of Reference. Specifically,

sampled sites should complement and expand upon sites established in 2006 by AMEC & LGL (2007). In addition, sampling should occur within Upper and Lower tributary sections delineated by AMEC & LGL (2006), which are located upstream and downstream of the Site C reservoir inundation level.

Eight tributaries were sampled (Table 1.1 and Figure 1.1):

Table 1.1 Study tributaries and sampled sections, Site C tributaries juvenile fish summer survey 2008.

Tributary	Section	Section Location (km)	Inundation Location <sup>a</sup> (Km)
Maurice Creek	Lower	Km 0.0 to 0.83	0.83
	Upper	Km 0.83 to 1.86	
Lynx Creek	Lower	Km 0.0 to 1.19	1.19
	Upper	Km 1.19 to 2.04	
Farrell Creek	Lower	Km 0.0 to 3.39	3.39
	Upper	Km 3.39 to 4.28	
Halfway River	Lower	Km 0.0 to 13.45	13.45
	Upper	Km 13.45 to 42.83	
Cache Creek	Lower	Km 0.0 to 7.02	7.02
	Upper	Km 7.02 to 11.09	
Red Creek <sup>b</sup>	Lower	Km 0.0 to 1.99	1.99
	Upper	Km 1.99 to 2.59	
Wilder Creek	Lower	Km 0.0 to 2.51	2.51
Moberly River	Lower	Km 0.0 to 9.11	9.11
	Upper	Km 9.11 to 21.43	

<sup>a</sup> Distance from confluence with the Peace River; assumes reservoir elevation of 461.8 m (see Section 2.2).

<sup>b</sup> Tributary to Cache Creek located 4.68 km upstream from confluence with the Peace River.

Reservoir inundation level locations on study tributaries were based on a maximum normal reservoir elevation of 461.8 metres plotted on orthophotos supplied by B.C. Hydro. Orthophotos were created from 1:20,000 and 1:40,000 scale photography; reservoir elevation was generated from BC Government TRIM mapping.

Water temperature monitoring sites were located close to the confluence of selected study tributaries (Figure 1.1). Water temperature was not monitored on Red Creek or Wilder Creek because both tributaries typically dewater during summer.

Discharge was measured in close proximity to water temperature monitoring sites. Discharge was not measured on the Halfway River or the Moberly River because data were available from Water Survey of Canada stations.

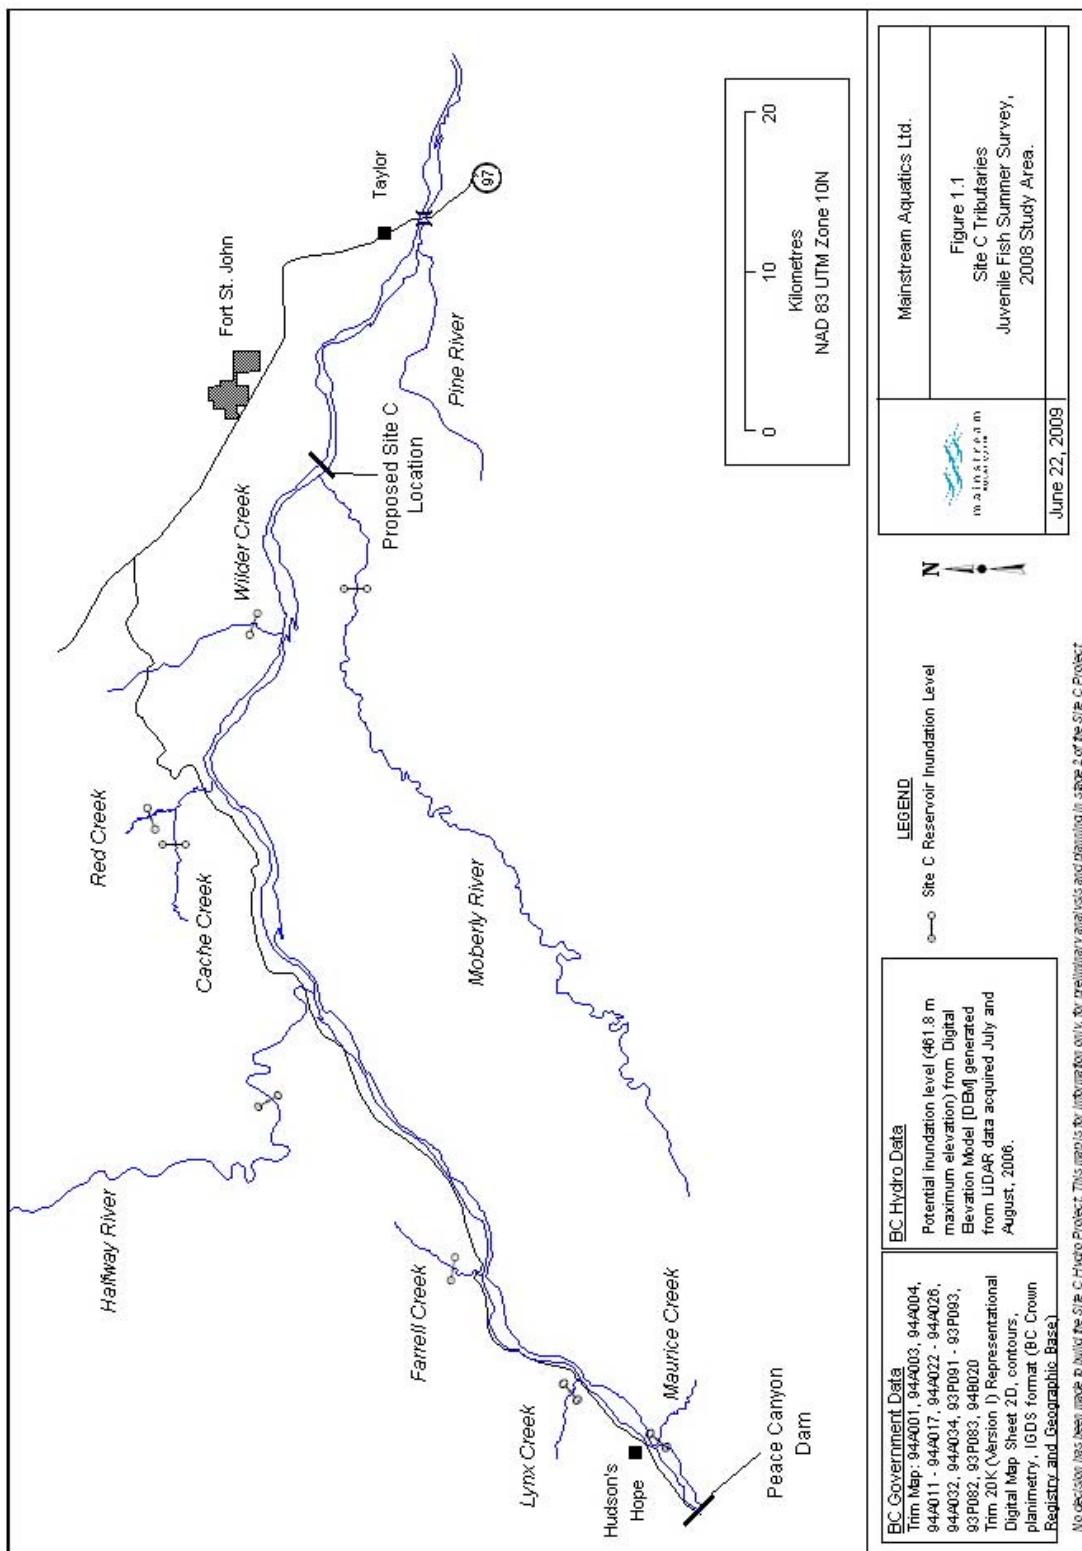

Appendix A1 identifies all site locations.

## **1.4 STUDY PERIOD**

The juvenile fish survey was completed during a 10-day period from 29 July to 7 August, 2008 (Table 1.2). Discharge and water temperature were monitored between 17 May and 26 October, 2008.

Table 1.2 Study tributaries sample dates, Site C tributaries juvenile fish summer survey 2008.

<b>Tributary</b>	<b>Survey Dates</b>
Maurice Creek	29, 30 July and 3 August
Lynx Creek	29 July to 1 August
Farrell Creek	31 July and 2, 3 August
Halfway River	30 July to 2 August
Cache Creek	3 August to 7 August
Red Creek	4 August and 6 August
Wilder Creek	7 August
Moberly River	4 August to 7 August

## **2.0 METHODS**

### **2.1 FIELD**

#### **2.1.1 Environmental Characteristics**

##### Water Temperature

During the open water period water temperature ( $\pm 0.1^{\circ}\text{C}$ ) in the tributaries was continuously monitored using Vemco Minilog 8 bit temperature data loggers. Data loggers, which were deployed near the tributary mouths upstream of the influence from the Peace River, recorded water temperatures at half hour intervals (Lynx Creek was monitored at 1.5 hour intervals). In addition, water temperature was measured opportunistically using a Hanna HI98311 EC/TDS meter ( $\pm 0.1^{\circ}\text{C}$ ).

##### Discharge

Discharge in ungauged tributaries was measured using a Swoffer 2100 velocity meter and staff rod using standard procedures described by Bain and Stevenson (1999) along a cross-section of the channel that was free of obstructions. At each point, water depth ( $\pm 0.1 \text{ m}$ ) was measured and water velocity ( $\pm 0.01 \text{ m/s}$ ) was measured at 40% of water depth from the channel bottom. Each point measured along the cross-section represented no greater than 10% of the estimated water flow. Discharge data were available from Water Survey of Canada for the Halfway River (Station 07FA006) and the Moberly River (Station 07FB008).

##### General Water Quality

Water clarity was measured to the nearest centimetre at sampled locations. A Hanna HI98311 EC/TDS meter was used to measure pH ( $\pm 0.01$ ) and conductivity ( $\pm 2\%$  full scale).

#### **2.1.2 Fish Habitat**

Habitat types in surveyed sections (Table 1.1) were classified according to O’Neil and Hildebrand (1986), which closely follow fish habitat assessment procedures (MOE 1995). The primary difference was separation of Glide habitat into Run or Flat habitat based on observed differences in water velocity. For the purpose of the assessment, rearing habitats were assumed to be Pools, Riffles, and Runs (and other habitat types) used by young fish.

##### Small Stream Habitat

In small wadeable tributaries, physical characteristics of discrete habitat types were measured in each survey section using fish habitat assessment procedures described in MOE (1995). Section length was

approximately 200 m, except on the Moberly River where 300 m was the targeted length. Habitat measurements were completed in a minimum of five units of the most abundant habitat types recorded in each survey section; less abundant habitats also were measured. Uniform sampling was used to select habitat units for measurement (every fourth unit). Physical characteristics of each selected habitat unit were measured along a cross-channel transect. Between 12 and 20 transects were used to measure physical characteristics at each site.

Parameters measured (definitions presented in Appendix B1) at each transect were as follows:

- Date and time
- Geodetic location
- Habitat type
- Wetted channel width (m)
- Bank full width (m)
- Water depth (m)
- Water velocity (m/s)
- Substrate composition (%)
- D90 (cm)
- Substrate embeddedness (low, moderate, high)
- Substrate compaction (low, moderate, high)
- Large organic debris (presence)
- Photograph

Water depth and water velocity were measured at  $\frac{1}{4}$ ,  $\frac{1}{2}$ , and  $\frac{3}{4}$  wetted channel width with a Swoffer Model 2100 velocity meter and staff rod. Percent substrate composition was visually estimated using a classification system based on the modified Wentworth Scale (Cummins 1962). A 2 m wide band situated perpendicular to each transect was used to visually assess substrate characteristics. D90 represented the average size of substrate particle that was in the 90<sup>th</sup> percentile and followed procedures outlined in MOE (1995). Embeddedness is the amount of fine particles (sand, silt, and clay) present within the substrate. Compaction evaluates the density or looseness of the substrate within the channel. Compaction and embeddedness were evaluated as low (1), moderate (2), or high (3). The presence or absence of large organic debris (woody debris), defined as having a diameter greater than 10 cm and a length greater than 1 m, also was recorded. Finally, digital photographs were taken of representative habitat types in each site.

#### Large Stream Habitat

In the Halfway River, which was not wadeable, physical characteristics of discrete habitat types were measured at each backpack electrofisher and beach seine site. For each site, a single transect was placed perpendicular to shore within the sampled area. Parameters measured at each fish sample site were similar to small stream protocols described above. Wetted width and bankfull width were not measured at Halfway River sites. Habitat characteristics were not recorded at boat electrofisher sites due to variable conditions (i.e., one fish sample site contained many habitats). However, the dominant habitat in each section was recorded.

### 2.1.3 Fish Capture

A broad definition was used to define juvenile fish. Juvenile fish were defined as younger age-groups of large-fish species (juveniles) and all small-fish species. The upper size limit of a juvenile fish was arbitrarily set at 200 mm fork length.

Three fish capture methods were employed during the study to target juvenile fish. These were backpack electrofisher, boat electrofisher, and beach seine. Backpack electrofisher was used to capture fish in all study tributaries. Standard sections containing multiple habitat units were sampled in wadeable tributaries. In the Halfway River, this method was used to sample discrete habitats containing rock substrates that could be effectively sampled by wading.

The Halfway River also was the only tributary where the other two methods were used (boat electrofisher and beach seine). Boat electrofisher was used to sample nearshore, shallow-water areas (i.e., <0.5 m water depth) with water velocities and water depths that prevented effective sampling by other methods. A beach seine was used to sample discrete habitats having low to zero water velocities that could be waded. The number and distribution of fish capture sites is summarized in Table 2.1.

Table 2.1 Number of sites by method, tributary and section,  
Site C tributaries juvenile fish summer survey 2008.

Waterbody	Section	Method and Number of Sites		
		Backpack Electrofish	Boat Electrofish	Beach Seine
Maurice Creek	Lower	1

Farrell Creek	Lower	3		
	Upper	3		
	Total	6		
Cache Creek	Lower	4		
	Upper	3		
	Total	7		
Red Creek	Lower	1		
	Upper	1		
	Total	2		
Moberly River	Lower	7		
	Upper	8		
	Total	15		
Halfway River	Lower	13	11	1
	Upper	16	14	6
	Total	29	25	7
<b>Total</b>		<b>68</b>	<b>25</b>	<b>7</b>

Parameters measured at each fish sample site were as follows:

- Date and time
- Geodetic location
- Sample method settings
- Sample effort (seconds/meters/width)
- Biological characteristics
  - species
  - fork length (mm)

#### Method Description

Two types of backpack electrofishers were used during the survey. One unit consisted of a Halltech H2-2000 high output backpack electrofisher with settings maintained at an output of 100-150 VDC, 5-7 ms and a frequency of 100 Hz. The other unit was a Smith-Root Type XII high output backpack electrofisher with settings maintained at an output of 300-400 VDC, 6 ms and a frequency of 60 Hz. The backpack electrofisher operator waded upstream along the channel margin and sampled suspected fish holding areas. The netter, who was positioned in close proximity to the electrofisher operator, collected immobilized fish and placed them in a holding bucket. A single pass was used at each site; sampled length was approximately 200 m, except on the Moberly River where 300 m was the target length. At each site, effort was recorded as time (s) and distance (m) sampled.

The boat electrofisher consisted of a double-bowed, inflatable drift boat equipped with a Smith-Root Type VIA electrofisher system, two fixed boom anodes on the bow and a cathode wire array on the stern. Electrofisher settings were maintained at an amperage output of 4.5 to 6.0 A, pulsed DC current at a frequency of 100 Hz. The sampling procedure involved the operator positioning the boat perpendicular to the channel margin while drifting downstream and outputting a continuous current of electricity. A single netter, equipped with a net having a mesh size of 0.5 cm, was positioned at the bow of the boat to capture the temporarily immobilized fish and place them in a 30 L live well. The netter was instructed not to bias their catch towards a particular species in order to provide a representative sample of the fish community. Sampled length of each site consisted of a single pass of approximately 1000 m. Effort for each site was recorded as time (s) and distance (m) sampled.

A beach seine was used in low velocity, deep water areas not effectively sampled by backpack electrofisher. The beach seine was 4.5 m wide and 1.5 m high with a stretched mesh size of 5.0 mm (the depth of the capture bag was 1.4 m). A two-person crew sampled parallel to the channel margin for a predetermined distance (30 m) before turning into shore. Captured fish were placed in a holding bucket for processing. Typically, one seine haul was conducted at each site. If sample effectiveness was low (e.g. snagged net), the site was re-sampled.

### Biological Characteristics

Data recorded for most captured fish included species and fork length (to the nearest mm). Total lengths were measured for fish less than 20 mm, sculpin species, and burbot. When the catch exceeded 10 individuals per species a sub-sample was measured. The first 10 individuals of each species were measured, while the remaining fish were identified and enumerated prior to release.

Each fish identified to species was assigned a four-letter species label (Mackay *et al.* 1990). The common name, scientific name and label of all fish species mentioned in this report are presented in Table 2.2.

Table 2.2 Fish species recorded during the Site C tributaries juvenile fish summer survey 2008.

Group	Common Name	Scientific Name	Species Label
<b>Sportfish</b>	Arctic grayling Bull trout Burbot Mountain whitefish Northern pike Rainbow trout	<i>Thymallus arcticus</i> <i>Salvelinus confluentus</i> <i>Lota lota</i> <i>Prosopium williamsoni</i> <i>Esox lucius</i> <i>Oncorhynchus mykiss</i>	ARGR BLTR BURB MNWH NRPK RNTR

Larger fish (>30 mm length) that could not be identified to species in the field were assigned a unique identifier and a subsample preserved for future identification. These fish were identified to species in the laboratory. Smaller fish that included young-of-the-year suckers and sculpins could not be identified to species using this method because a unique species identifier could not be assigned in the field. For these fish, the following method was employed. The percent composition of identified species in the sample was calculated. The calculated percentage for each species was then applied to the sample of unidentified fish. For example, if 50% of a sample was identified as longnose sucker, 10 of 20 unidentified fish in that sample were designated as longnose sucker.

This approach was used for the following numbers of fish:

Group	<u>Halfway River</u>	<u>Farrell Creek</u>	<u>Maurice Creek</u>	<u>Moberly River</u>
Suckers	17	2	0	325
Sculpins	0	0	4	0

A non-lethal ageing structure (scale) was collected from a sub-sample of sportfish to confirm the age class (Age 0 or Age 1). Structures were placed in labelled envelopes and air-dried before storage.

## **2.2 OFFICE**

Most data collected in the field were recorded on standardized forms (Water temperature data were imported into Microsoft Excel™. Forms were checked daily for errors or omissions. Data were entered into standardized data entry spreadsheets using Microsoft Excel™. The data was visually compared to the field forms for errors and subjected to several summary analyses including graphical examination to identify errors and outliers. The checked fish and habitat data were then imported into a single Microsoft Access™ data file for management and storage. Water temperature and discharge data were stored in Microsoft Excel™.

### Mapping

Geodetic location information (UTM coordinates) were tabulated and plotted onto geo-referenced base maps (BC TRIM, scale 1:20,000) using MapInfo Professional™. River kilometre locations were then plotted on base maps. Km 0 designated the tributary confluence with the Peace River.

Reservoir inundation level locations on study tributaries were based on a maximum normal reservoir elevation of 461.8 metres plotted on orthophotos supplied by B.C. Hydro. Orthophotos were created from 1:20,000 and 1:40,000 scale photography; reservoir elevation was generated from BC Government TRIM mapping.

### Habitat

Parameters measured along transects within discrete habitat units were summarized by habitat type for each tributary section. Summaries were presented as mean ± standard error.

### Catch Rate

Catch rate or catch-per-unit-effort (CPUE) of fish was calculated for each site by dividing the number of fish captured by sampling effort. CPUE was expressed as follows:

Backpack electrofisher -	Number of fish/100 m
Boat electrofisher -	Number of fish/km
Beach seine-	Number of fish/100 m <sup>2</sup>

### Fish Biological Characteristics

Structures from selected sportfish species were aged to ascertain the range in length of Age 0 and Age 1 fish in sample populations. Ageing procedures followed those described in Mackay *et al.* (1990). Scales were cleaned and placed on a microscope slide for viewing. All structures were read by two experienced individuals. If a discrepancy occurred between readers a third person examined the structure and a consensus reached as to the age of the structure.

Age data were used to confirm age-group designations based on modal peaks illustrated by length frequency distributions. Age-groups of interest were Age 0 or young-of-the year (YOY) and Age 1 or juvenile.

### Habitat Preference

A general indication of habitat preference by fish was provided by examining the Pearson correlation coefficient between catch rate and physical attributes of sampled habitats (Sokal and Rohlf 1981). Statistical significance was accepted at  $P \leq 0.10$ .

This page is intentionally blank.

## 3.0 RESULTS

### 3.1 MAURICE CREEK

#### 3.1.1 Environmental Characteristics

##### General Water Quality

During the juvenile fish survey average water pH was 8.0 in the Lower Section and 8.8 in the Upper Section (Table 3.1; Appendix C1). Average water conductivity was 455 µS/cm and 421 µS/cm, respectively. Water conductivity of Maurice Creek was considered high and suggested input from ground water sources. Water clarity of Maurice Creek was high during the small fish survey (i.e., to channel bed).

Table 3.1 General water quality of study tributaries, Site C tributaries juvenile fish summer survey 2008.

Waterbody	Section	pH			Conductivity (µS/cm)			Water clarity (cm)		
		n	Average	Range	n	Average	Range	n	Average	Range

<sup>a</sup> To channel bed.

##### Water Temperature

Maurice Creek water temperatures were monitored between 21 May and 9 October 2008 (Figure 3.1; Appendix C2A). During that time temperatures ranged between 3.4°C and 23.7°C with an average of 13.6°C. Average daily water temperatures were approximately 10°C at the beginning of the temperature monitoring program (17 May). They increased during June through to July and then remained high (approximately 16°C) until the middle of August. Temperatures then declined until October when the thermograph was removed.

There was a large difference between daily minimum and maximum water temperatures of Maurice Creek, particularly during the warmest months of July and August. During this period the range

in daily temperature was as high as 9.6°C. In addition, maximum water temperatures were elevated during July and August. Water temperatures exceeded 22°C on six days during the summer.

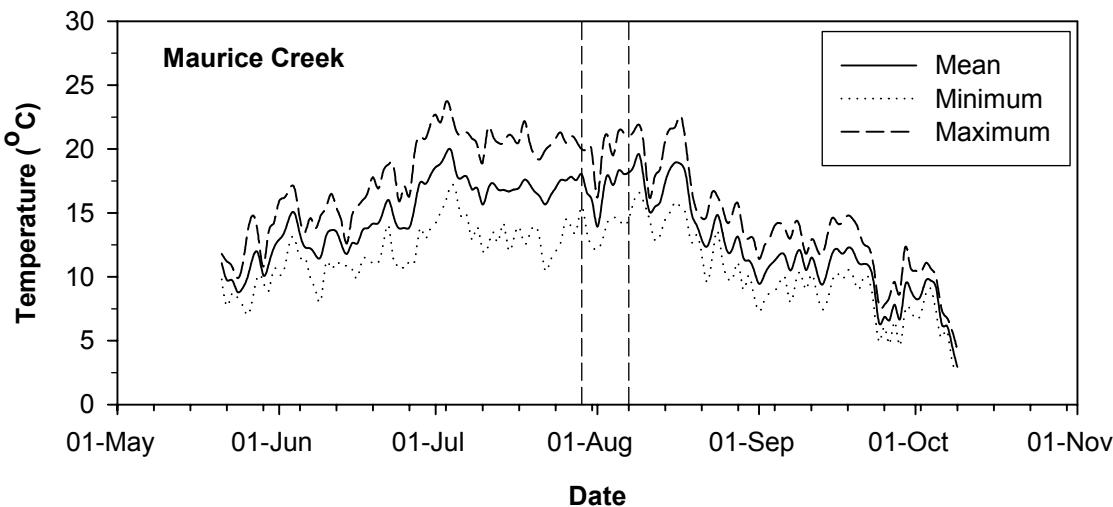

Figure 3.1 Daily water temperatures of Maurice Creek, Site C tributaries juvenile fish summer survey 2008 (dashed lines represent juvenile fish survey period).

Water temperatures were high during the juvenile fish survey. Average daily water temperature was 17.0°C and ranged from 12.1°C to 21.3°C.

#### Discharge

Discharge of Maurice Creek was measured during spring freshet, as well as during base flows in summer and fall (Figure 3.2; Appendix C3). Measured discharge ranged between 1.5 m<sup>3</sup>/s and 8.3 m<sup>3</sup>/s during the spring period (16 May to 5 June). Water flows declined substantially by summer. During summer and fall recorded discharge was 0.03 m<sup>3</sup>/s (29 July) and 0.23m<sup>3</sup>/s (9 October).

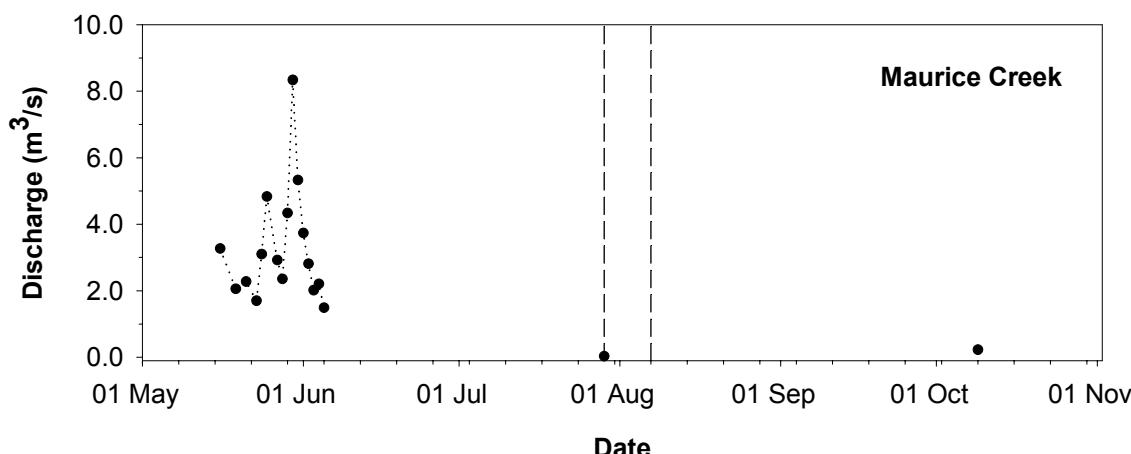

Figure 3.2 Discharge of Maurice Creek, Site C tributaries juvenile fish summer survey 2008 (points represent measurements; dashed lines represent juvenile fish survey period).

### 3.1.2 Fish Habitat

The major habitat types recorded at sampled sites on Maurice Creek were Pools, Riffles, and Runs (Table 3.2; Plate 1; Appendix D1). Other habitats recorded included a Flat and a Falls in the Upper Section. At the time of the survey the falls were a barrier to upstream fish passage (Plate 2), but it was likely that upstream fish passage was possible at higher flows.

Table 3.2 Physical characteristics of fish habitats (mean  $\pm$  SE) in Lower and Upper sections of Maurice Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	n	Bankfull Width (m)	Wetted Width (m)	Water Depth (m)	Water Velocity ( $m^3/s$ )
Lower (Sites = 1)	Flat	0				
	Pool	5	11.0 $\pm$ 0.3	5.4 $\pm$ 0.4	0.47 $\pm$ 0.09	<0.01
	Riffle	5	12.8 $\pm$ 1.0	5.9 $\pm$ 1.4	0.10 $\pm$ 0.03	0.21 $\pm$ 0.07
	Run	5	13.9 $\pm$ 1.5	5.3 $\pm$ 0.8	0.15 $\pm$ 0.02	0.04 $\pm$ 0.01
	Falls	0				
	Average <sup>a</sup>	15	12.5 $\pm$ 0.7	5.5 $\pm$ 0.5	0.24 $\pm$ 0.05	0.08 $\pm$ 0.03
Upper (Sites = 2)	Flat	1	12.9	8.5	0.54	0.00
	Pool	8	15.4 $\pm$ 1.4	6.5 $\pm$ 1.0	0.39 $\pm$ 0.04	0.01 $\pm$ 0.002
	Riffle	7	14.7 $\pm$ 1.0	5.2 $\pm$ 1.2	0.07 $\pm$ 0.01	0.18 $\pm$ 0.09
	Run	8	16.5 $\pm$ 1.5	5.3 $\pm$ 0.7	0.13 $\pm$ 0.02	0.07 $\pm$ 0.04
	Falls	1	17.5	15.3	0.12	0.04
	Average <sup>a</sup>	23	15.5 $\pm$ 0.8	5.7 $\pm$ 0.6	0.20 $\pm$ 0.03	0.08 $\pm$ 0.03

<sup>a</sup> Includes data from Pool, Run, and Riffle.

Plate 1: Riffle-Run complex on Maurice Creek, summer 2008.

Plate 2: Falls on Maurice Creek, summer 2008.

Wetted channel width was approximately 40% of bankfull width, water depth was generally less than 0.25 m, and water velocities were generally low. As expected, Pool habitats exhibited greater water depths (0.40 m). These values were indicative of base flow conditions during the survey.

Cobbles and/or Boulders/Bedrock dominated the bed materials in most habitats (Table 3.3). The primary exception was the large percentage of Fines (clays, silts, and sands) in Pool habitat. D90 exceeded 22 cm in all habitats except Flat in the Upper Section, which indicated substantial stream power at high flows.

Table 3.3 Bed material characteristics of fish habitats (mean  $\pm$  SE) in Lower and Upper sections of Maurice Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	<i>n</i>	D90 (cm)	Bed Material Type (%)				Condition

<sup>a</sup> Includes data from Pool, Run, and Riffle.

Bed material embeddedness and compaction was low to moderate (1 to 2) in surveyed sections.

The physical and bed material characteristics of the Lower Section and Upper Section were very similar (Figure 3.3). The only apparent differences were bankfull width (12.5 m versus 15.5 m, respectively) and percentage of Fines (34% versus 22%, respectively).

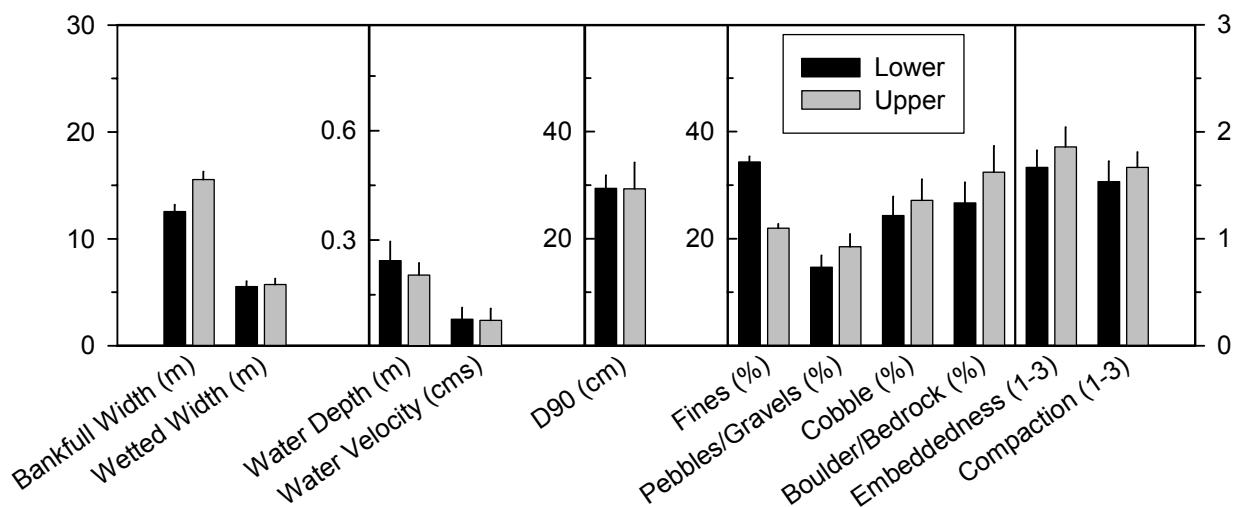

Figure 3.3 Physical and bed material characteristics (mean  $\pm$  SE) of Lower and Upper sections of Maurice Creek, Site C tributaries juvenile fish summer survey 2008 (includes Pool, Run, and Riffle data).

### 3.1.3 Fish Composition, Distribution and Relative Abundance

#### Species Composition

In total, 385 fish were recorded during the juvenile fish survey in Maurice Creek (Table 3.4). The sample consisted of 7 species, which included 2 sportfish, 1 sucker, 1 minnow, and 3 sculpin species. Sportfish accounted for the largest percentage of the total sample, 61.0%, and rainbow trout was the numerically dominant species (60.8%). Longnose sucker was the only species in the sucker group, 14.0% of the total sample, and the single minnow species recorded (longnose dace) represented 10.4% of the total sample.

The sculpin group was the second most important group, 14.5% of the total sample. Slimy sculpin was the numerically dominant species in the group (11.4%), followed by prickly sculpin (2.6%), and spoonhead sculpin (<1%).

Table 3.4 Fish species composition in Lower and Upper sections of Maurice Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower (n = 1)		Upper (n = 2)		Total	
		Number	Percent	Number	Percent	Number	Percent

	<i>Subtotal</i>	9	12.9	31	10.0	40	10.4
Sculpins	Prickly sculpin	5	7.1	5	1.6	10	2.6
	Slimy sculpin	10	14.3	34	10.8	44	11.4
	Spoonhead sculpin	0		2	0.6	2	0.5
	<i>Subtotal</i>	15	21.4	41	13.0	56	14.5
<b>Total</b>		<b>70</b>	<b>100.0</b>	<b>315</b>	<b>100.0</b>	<b>385</b>	<b>100.0</b>
<b>Number of Species</b>		<b>6</b>		<b>6</b>		<b>7</b>	

### Distribution

The number of fish species was similar in the Upper Section and Lower Section of Maurice Creek (Table 3.4). Exceptions included mountain whitefish, which were recorded only in the Lower Section and spoonhead sculpin, which were recorded only in the Upper Section.

### Relative Abundance

Rainbow trout was the most abundant fish species recorded in Maurice Creek (Figure 3.4; Appendix E1). Catch rates were high in the Lower Section (20.0 fish/100 m) and very high in the Upper Section (69.9 fish/100 m). Catch rates of all other species were lower than rainbow trout catch rates; however, differences in spatial abundance were similar for longnose sucker, longnose dace, and slimy sculpin. Fish were more abundant in the Upper Section compared to the Lower Section. Catch rates of longnose sucker and slimy sculpin were less than 5 fish/100 m in the Lower Section compared to greater than 18 fish/100 m in the Upper Section. The spatial difference of longnose dace catch rates was not as large (4.5 fish/100 m versus 9.1 fish/100 m).

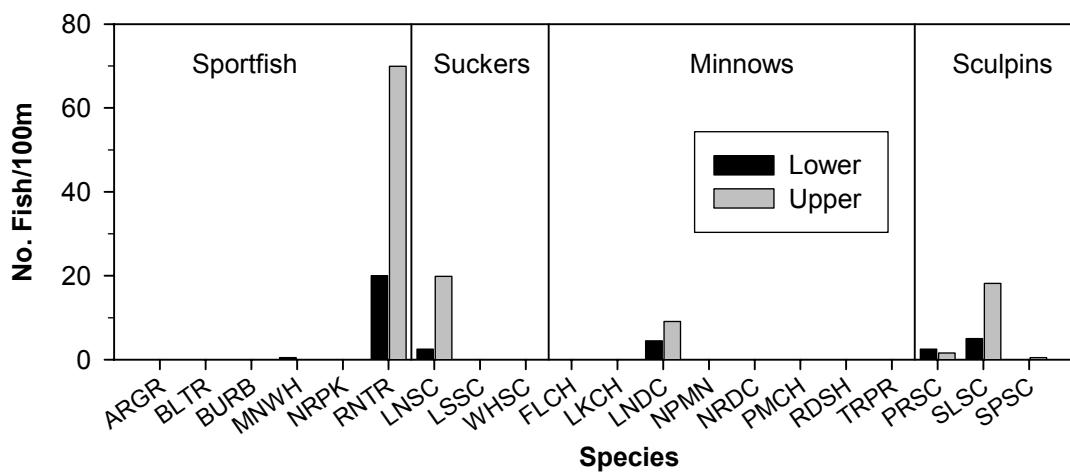

Figure 3.4 Fish catch rates in Lower and Upper sections of Maurice Creek, Site C tributaries juvenile fish summer survey 2008.

### **3.1.4 Fish Biological Characteristics**

The length characteristics of sampled fish from Maurice Creek indicated that large-fish species (rainbow trout and longnose sucker) populations were dominated by Age 0 and Age 1 fish (Table 3.5 and Figure 3.5; Appendix F1). Median lengths of samples collected from rainbow trout were 93 mm in the Lower Section and 45 mm in the Upper Section. The catch rates of Age 0 fish (8.5 fish/100 m in Lower versus 55.7 fish/100 m in Upper) confirmed that there were spatial differences in the distribution of Age 0 rainbow trout in Maurice Creek.

Table 3.5 Length characteristics of fish species sampled from Lower and Upper sections of Maurice Creek, Site C tributaries juvenile fish summer surveys 2008.

Group	Species	Lower Section			Upper Section		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Sportfish	Mountain whitefish	1	53		0		
	Rainbow trout	40	93	30 - 158	194	45	27 - 168
Suckers	Longnose sucker	5	102	27 - 124	27	81	21 - 133
Minnows	Longnose dace	9	61	13 - 68	12	66	18 - 130
Sculpins	Prickly sculpin	5	73	69 - 105	5	85	71 - 108
	Slimy sculpin	10	67	30 - 93	31	50	26 - 81
	Spoonhead sculpin	0			1	91

## 3.2 LYNX CREEK

### 3.2.1 Environmental Characteristics

#### General Water Quality

During the juvenile fish survey on Lynx Creek average water pH was 8.1 in the Lower Section and 8.3 in the Upper Section (Table 3.1; Appendix C1). Water conductivity was high – average values were 603  $\mu\text{S}/\text{cm}$  and 577  $\mu\text{S}/\text{cm}$ , respectively. Water clarity was to the channel bottom; however, visual observations indicated some turbidity at the time of sampling.

#### Water Temperature

Lynx Creek water temperatures were monitored between 21 May and 13 October 2008 (Figure 3.6; Appendix C2B). During that time temperatures ranged between 5.2°C and 17.5°C with an average of 12.3°C. Average daily water temperatures were approximately 11°C at the beginning of the monitoring program (17 May). They increased slightly through June and July and remained at approximately 15°C until the middle of August. Water temperatures then declined until early October when the thermograph was removed.

Diel water temperatures did not vary considerably in Lynx Creek, even during the warmest months of July and August. During this period the highest range in temperature during any given day was 3.3°C.

Average daily water temperature during the juvenile fish survey was 14.6°C – it ranged from 12.3°C to 16.6°C. Unlike other small tributaries surveyed during the program, maximum water temperatures never exceeded 22°C.

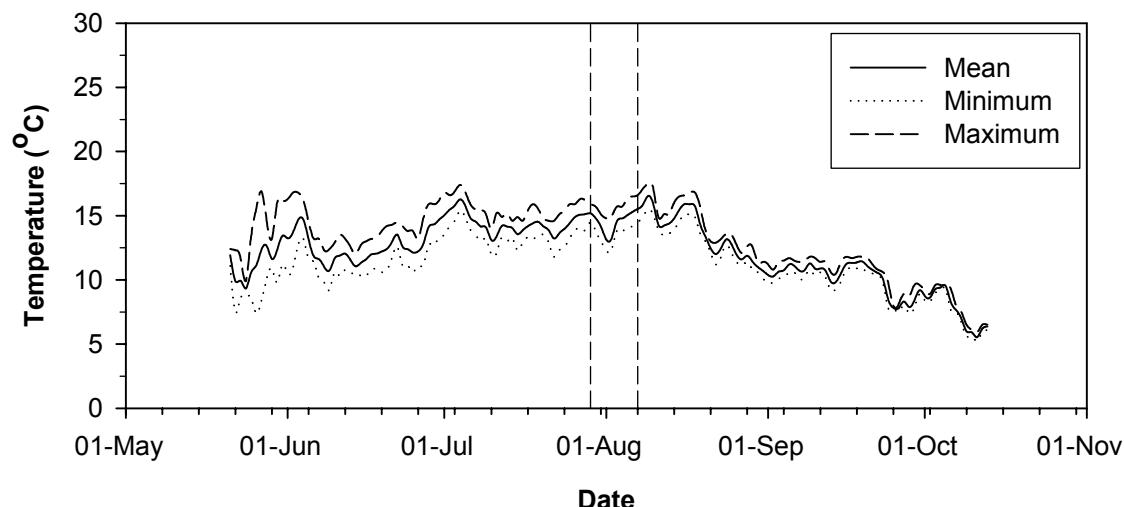

Figure 3.6 Daily water temperatures of Lynx Creek, Site C tributaries juvenile fish summer survey 2008 (dashed lines represent juvenile fish survey period).

### Discharge

Discharge of Lynx Creek was measured during spring freshet, and during base flows in summer and fall (Figure 3.7; Appendix C3). Measured discharge ranged from 0.7 m<sup>3</sup>/s to 1.8 m<sup>3</sup>/s during the spring period (17 May to 5 June). Water flows declined substantially by summer. Recorded average discharge was 0.1 m<sup>3</sup>/s from 29 July to 1 August and 0.1 m<sup>3</sup>/s from 9 October to 13 October.

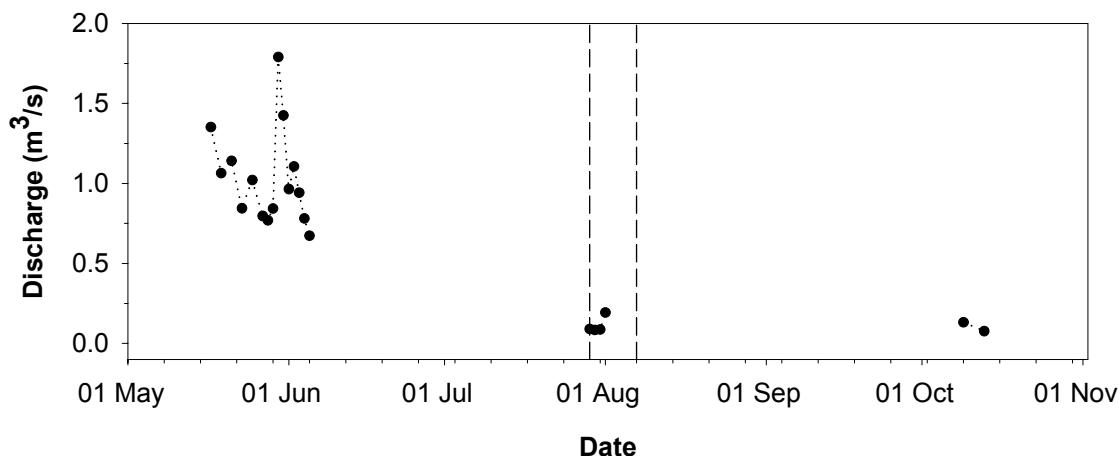

Figure 3.7 Measured discharge of Lynx Creek, Site C tributaries juvenile fish summer survey 2008 (points represent measurements; dashed lines represent juvenile fish survey period).

### 3.2.2 Fish Habitat

The major habitat types recorded at sampled sites on Lynx Creek were Pools, Riffles, and Runs (Table 3.6; Plates 3 and 4; Appendix D1). There were also five Flats in the Upper Section and three Flats in the Lower Section sampled. Although not specifically sampled in Lynx Creek, Beaver Impoundments were prevalent in the Upper Section.

Table 3.6 Physical characteristics of fish habitats (mean ± SE) in Lower and Upper sections of Lynx Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	n	Bankfull Width (m)	Wetted Width (m)	Water Depth (m)	Water Velocity (m <sup>3</sup> /s)
Lower (n=3)	Flat	3	9.6 ± 2.4	6.3 ± 0.1	0.18 ± 0.01	0.12 ± 0.03
	Pool	14	10.7 ± 0.8	5.1 ± 0.7	0.29 ± 0.03	0.12 ± 0.02
	Riffle	22	10.2 ± 0.4	6.3 ± 0.4	0.13 ± 0.03	0.45 ± 0.03
	Run	16	10.0 ± 0.6	5.1 ± 0.3	0.15 ± 0.01	0.24 ± 0.02
	Average <sup>a</sup>	52	10.3 ± 0.3	5.6 ± 0.3	0.18 ± 0.02	0.29 ± 0.02
Upper (n=3)	Flat	5	8.9 ± 0.6	5.9 ± 0.8	0.19 ± 0.03	0.14 ± 0.02
	Pool	16	10.6 ± 0.9	7.2 ± 1.2	0.33 ± 0.04	0.14 ± 0.03
	Riffle	23	10.0 ± 0.4	6.6 ± 0.3	0.12 ± 0.01	0.46 ± 0.04
	Run	21	9.6 ± 0.3	5.8 ± 0.3	0.17 ± 0.01	0.29 ± 0.03
	Average <sup>a</sup>	60	10.0 ± 0.3	6.5 ± 0.4	0.19 ± 0.02	0.33 ± 0.03

<sup>a</sup> Includes data from Pool, Run, and Riffle.

**Plate 3:** Riffle-Run complex on Lynx Creek, summer 2008.

**Plate 4:** Beaver Impoundment on Lynx Creek, summer 2008.

Wetted channel width was approximately 60% of bankfull width, water depth was generally less than 0.20 m (Pools > 0.30 m), and water velocities were less than 0.30 m/s (Riffles > 0.45 m/s). Fines dominated the bed materials in most habitats (Table 3.7). The percentage of Fines was less in Riffles and Runs. D90 exceeded 38 cm in all habitats, which indicated substantial stream power at high flows. Bed material embeddedness and compaction was variable (range of 1 to 3). Embeddedness was higher in Flat and Pool habitats which were characterized by lower water velocities.

Table 3.7 Bed material characteristics of fish habitats in Lower and Upper sections of Lynx Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	<i>n</i>	D90 (cm)	Bed Material Type (%)				Substrate Condition	
				Fines	PE/GR	CO	BO/BE	Embedd.	Compact.
Lower (n=3)	Flat	3	45.7 ± 21.2	60 ± 5	15 ± 3	15 ± 3	10 ± 5	3.0	1.0
	Pool	14	46.7 ± 7.8	60 ± 5	14 ± 2	15 ± 2	11 ± 3	2.8 ± 0.1	1.4 ± 0.1
	Riffle	22	57.6 ± 9.6	29 ± 2	20 ± 2	25 ± 2	26 ± 4	1.2 ± 0.1	2.1 ± 0.2
	Run	16	38.3 ± 6.3	38 ± 3	24 ± 1	24 ± 1	14 ± 3	2.1 ± 0.1	1.4 ± 0.1
	Average <sup>a</sup>	52	48.6 ± 4.9	40 ± 1	20 ± 1	22 ± 1	18 ± 2	1.9 ± 0.1	1.7 ± 0.1

	Pool	16	71.4 ± 15.0	46 ± 3	17 ± 2	19 ± 1	19 ± 3	2.8 ± 0.1	2.2 ± 0.2
	Riffle	23	58.2 ± 11.6	33 ± 2	22 ± 1	26 ± 1	19 ± 2	1.1 ± 0.1	2.7 ± 0.1
	Run	21	65.9 ± 19.7	41 ± 2	20 ± 1	21 ± 1	18 ± 2	1.7 ± 0.1	2.5 ± 0.1
	Average <sup>a</sup>	60	64.4 ± 9.0	39 ± 1	20 ± 1	23 ± 1	18 ± 1	1.8 ± 0.1	2.5 ± 0.1

<sup>a</sup> Includes data from Pool, Run, and Riffle.

The physical and bed material characteristics of the Lower Section and Upper Section were very similar (Figure 3.8). The only distinct differences were D90 (48.6 cm versus 64.4 cm, respectively), and compaction (1.7 versus 2.5, respectively).

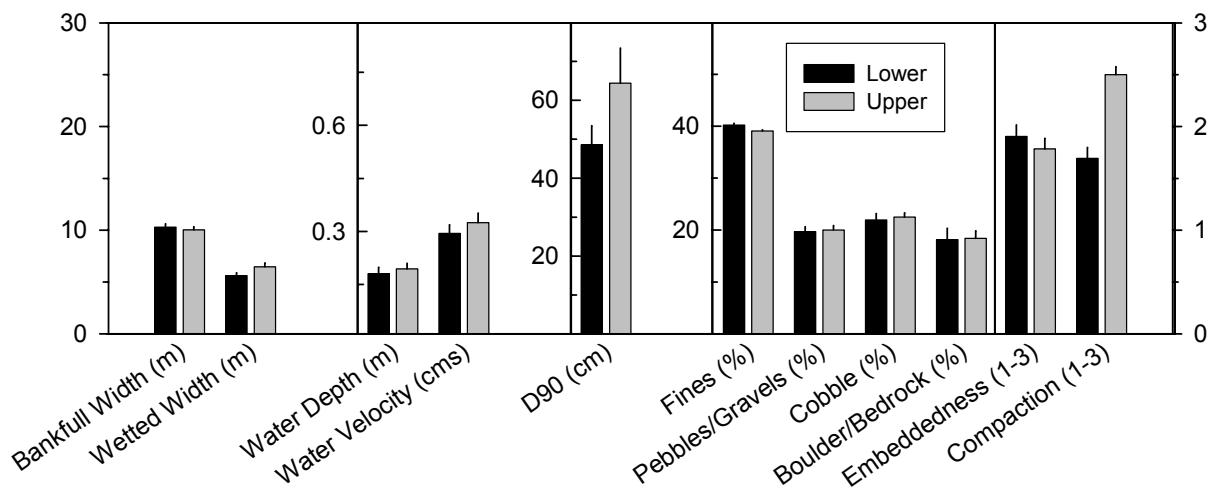

Figure 3.8 Physical and bed material characteristics (mean  $\pm$  SE) of in Lower and Upper sections of Lynx Creek, Site C tributaries juvenile fish survey 2008 (includes Pool, Run, and Riffle data).

### 3.2.3 Fish Composition, Relative Abundance and Distribution

#### Species Composition

In total, 236 fish were recorded during the small fish survey in Lynx Creek (Table 3.8). The sample consisted of 11 species, which included 2 sportfish, 2 sucker, 5 minnow, and 2 sculpin species. Sportfish accounted for 21.6% of the total sample and consisted of rainbow trout (18.2%) and mountain whitefish (3.4%). The sucker group accounted for 30.9% of the total sample. Longnose sucker (30.1%) was the numerically dominant species -- largescale sucker was scarce (0.8%). The minnows were the dominant group recorded in Lynx Creek (41.9% of the total sample). Lake chub was numerically dominant (30.5%) followed by longnose dace (8.1%). The remaining minnow species accounted for 3.3% of the total sample. The sculpin group were comprised of prickly sculpin (3.4%) and slimy sculpin (2.1%).

#### Distribution

The number of fish species was the same in the Lower Section and Upper Section of Lynx Creek (Table 3.8). Although the number of species was the same, northern pikeminnow and prickly sculpin were only recorded in the Lower Section. Largescale sucker and flathead chub were recorded only in the Upper Section.

#### Relative Abundance

Catch rate data indicated that fish were more abundant in the Upper Section of Lynx Creek (Figure 3.9; Appendix E1). Lake chub was the most abundant fish species recorded. Catch rates were 1.1 fish/100 m in the Lower Section and 10.5 fish/100 m in the Upper Section.

Table 3.8 Fish species composition in Lower and Upper sections of Lynx Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower (n=3)		Upper (n=3)		Total	
		Number	Percent	Number	Percent	Number	Percent

<b>Total</b>	<i>Subtotal</i>	12	21.1	1	0.6	13	5.5
	<b>Number of Species</b>	<b>9</b>		<b>9</b>		<b>11</b>	

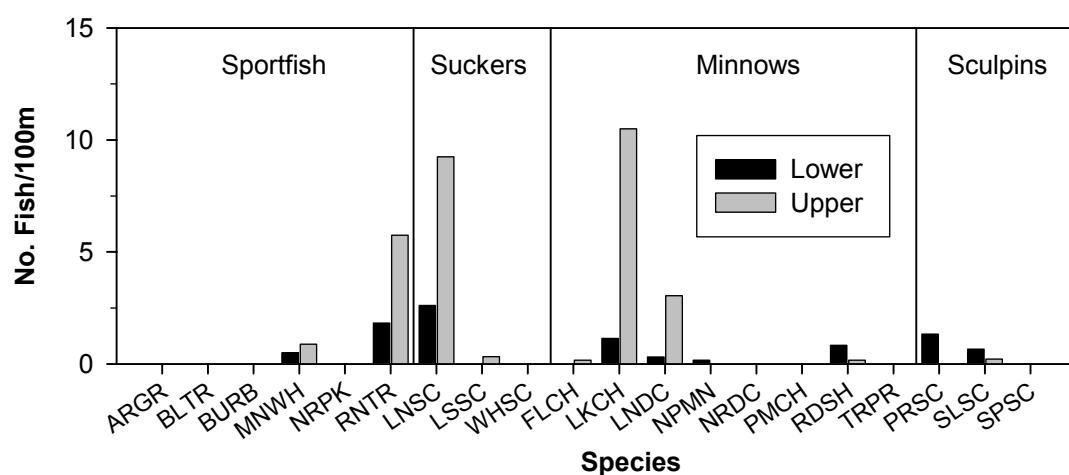

Figure 3.9 Fish catch rates in Lower and Upper sections of Lynx Creek, Site C tributaries juvenile fish summer survey 2008.

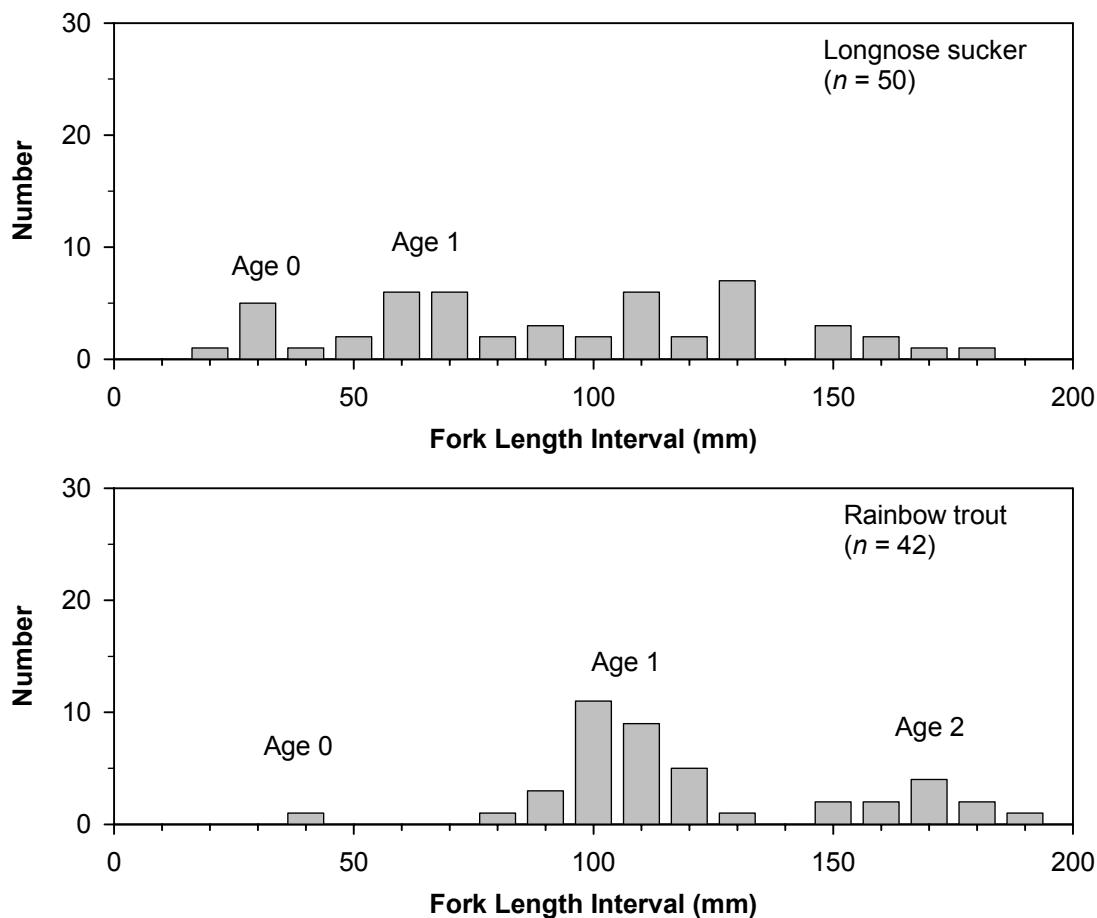

Similar spatial differences were recorded for the other numerically abundant species including rainbow trout, longnose sucker, and longnose dace. For example catch rates of rainbow trout were 1.8 fish/100 m in the Lower Section compared to 5.7 fish/100 m in the Upper Section.

### 3.2.4 Fish Biological Characteristics

The length characteristics of sampled fish from Lynx Creek indicated that large-fish species such as rainbow trout, mountain whitefish, and longnose sucker were dominated by younger fish (Table 3.9 and Figure 3.10; Appendix F1). Rainbow trout and longnose sucker samples were dominated by Age 1 fish, while the majority of captured mountain whitefish were Age 0 fish. Only one Age 0 rainbow trout was recorded from Lynx Creek. This fish was captured in the Upper Section. There were no large differences in fish size between the Lower and Upper Section.

Table 3.9 Length characteristics of fish species sampled from Lower and Upper sections of Lynx Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower			Upper		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Sportfish	Mountain whitefish	3	53	51 – 61	5	65	63 – 130
	Rainbow trout	11	117	94 – 193	32	111.5	48 – 218
Suckers	Longnose suckers	16	88	35 – 265	35	101	29 – 183
	Largescale suckers	0			2	132.5	123 – 142
Minnows	Flathead chub	0			1	72	
	Lake chub	7	58	52 – 62	34	56	45 – 155
	Longnose dace	2	61.5	48 – 75	17	70	50 – 105
	Northern pikeminnow	1	186		0		
	Redside shiner	5	59	53 – 63	1	65.0	65
Sculpins	Prickly sculpin	8	43.5	34 – 101	0		
	Slimy sculpin	4	49	41 – 74	1	80	

#### Water Temperature

Farrell Creek water temperatures were monitored between 21 May and 13 October 2008 (Figure 3.11; Appendix C2C). During that time temperatures ranged between 2.6°C and 27.3°C with an average of 15.5°C. Average daily water temperatures were approximately 13°C at the beginning of the monitoring program (17 May).

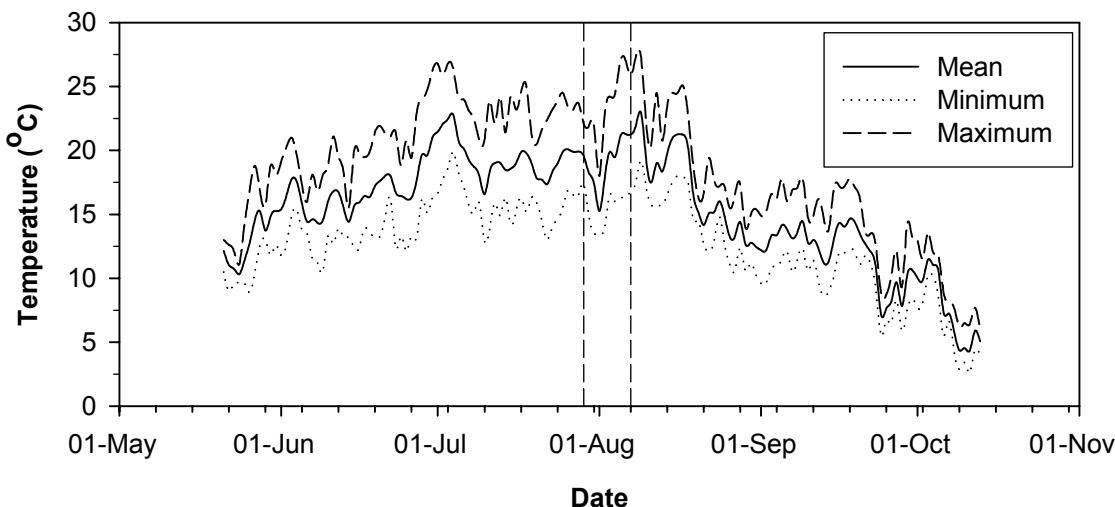

Figure 3.11 Daily water temperatures of Farrell Creek, Site C tributaries juvenile fish summer survey 2008 (dashed lines represent juvenile fish survey period).

Temperatures increased during June through to July and then remained high (approximately 18°C) until the middle of August. Water temperatures then declined until early October when the thermograph was removed. The maximum water temperatures were elevated during the summer months of July and August. Water temperatures exceeded 22°C on 42 days during the summer. The difference between daily minimum and maximum water temperatures of Farrell Creek was large. During July and August the range in diel water temperature reached 10.8°C.

Average daily water temperature during the juvenile fish survey was 19.1°C and ranged from 13.5°C to 27.1°C.

#### Discharge

Discharge of Farrell Creek was measured during spring freshet, as well as during base flows in summer and fall (Figure 3.12; Appendix C3). Measured discharge ranged from 2.4 m<sup>3</sup>/s to 5.1 m<sup>3</sup>/s during the spring period (17 May to 5 June). Water flows declined substantially by summer. Recorded average discharge was 0.1 m<sup>3</sup>/s from 30 July to 3 August and 0.2 m<sup>3</sup>/s from 9 October to 13 October.

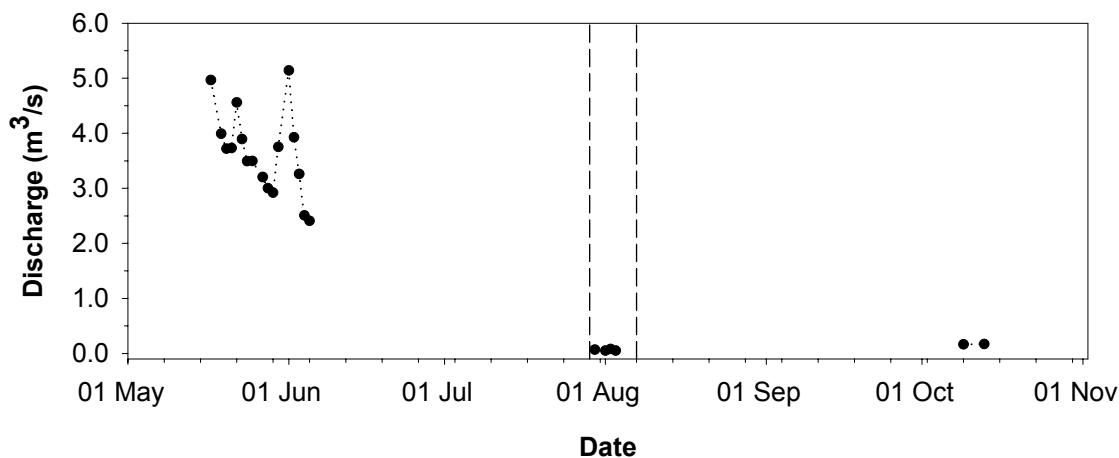

Figure 3.12 Measured discharge of Farrell Creek, Site C tributaries juvenile fish summer survey 2008 (points represent measurements; dashed lines represent juvenile fish survey period).

### 3.3.2 Fish Habitat

The major habitat types recorded in sampled sections on Farrell Creek were Pools, Riffles, and Runs (Table 3.10; Plate 5; Appendix E1). Other habitats recorded included a Cascade and three Flats in the Lower Section and a Beaver Impoundment (Plate 6) and one Flat in the Upper Section.

Table 3.10 Physical characteristics of fish habitats (mean  $\pm$  SE) in Lower and Upper sections of Farrell Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	n	Bankfull Width (m)	Wetted Width (m)	Water Depth (m)	Water Velocity ( $\text{m}^3/\text{s}$ )
Lower (n=3)	Flat	3	$14.5 \pm 1.2$	$8.7 \pm 0.6$	$0.32 \pm 0.06$	<0.01
	Pool	13	$16.2 \pm 0.9$	$8.7 \pm 0.9$	$0.45 \pm 0.04$	$0.04 \pm 0.01$
	Riffle	15	$18.3 \pm 0.7$	$10.4 \pm 1.1$	$0.1 \pm 0.01$	$0.24 \pm 0.03$
	Run	15	$15.9 \pm 1.0$	$7.2 \pm 0.5$	$0.19 \pm 0.02$	$0.10 \pm 0.02$
	Cascade	1	18.4	6.0	0.22	0.22
	Impoundment	0				
	Average <sup>a</sup>	43	$16.9 \pm 0.5$	$8.8 \pm 0.5$	$0.24 \pm 0.03$	$0.13 \pm 0.02$
Upper (n=3)	Flat	1	17.2	8.0	0.14	0.02
	Pool	15	$16.1 \pm 0.9$	$7.6 \pm 0.4$	$0.39 \pm 0.04$	$0.04 \pm 0.01$
	Riffle	16	$17.5 \pm 1.3$	$9.5 \pm 0.8$	$0.08 \pm 0.01$	$0.17 \pm 0.02$
	Run	14	$17.8 \pm 1.2$	$6.6 \pm 0.5$	$0.19 \pm 0.01$	$0.10 \pm 0.01$
	Cascade	0				
	Impoundment	1	21.3	16.2	0.44	<0.01
	Average <sup>a</sup>	45	$17.1 \pm 0.6$	$7.9 \pm 0.4$	$0.22 \pm 0.02$	$0.10 \pm 0.01$

<sup>a</sup> Includes data from Pool, Run, and Riffle.

Wetted channel width was approximately 50% of bankfull width, water depth averaged less than 0.25 m, and water velocities were generally low (<0.10 m/s). As expected, Pool habitats exhibited greater water depths (approximately 0.40 m) and higher water velocities were recorded in Riffles (>0.15 m/s). These values were indicative of base flow conditions at the time of the survey.

**Plate 5:** Typical Riffle-Pool-Run complex on Farrell Creek, summer 2008.

**Plate 6:** Beaver Impoundment on Farrell Creek, summer 2008.

Smaller rock bed materials (i.e., pebbles and gravels) dominated in all habitats including the Impoundment (Table 3.11), while Pool and Flat habitats exhibited a high percentage of Fines (>25%).

Table 3.11 Bed material characteristics of fish habitats (mean  $\pm$  SE) in Lower and Upper sections of Farrell Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	<i>n</i>	D90 (cm)	Bed Material Type (%)				Substrate Condition

	Cascade	0							
	Impoundment	1	15	45	40	10	5	2	2
	Average <sup>a</sup>	45	19.7 $\pm$ 0.8	30 $\pm$ 1	50 $\pm$ 2	15 $\pm$ 1	6 $\pm$ 1	2.2 $\pm$ 0.1	2.2 $\pm$ 0.1

<sup>a</sup> Includes data from Pool, Run, and Riffle.

D90 exceeded 15 cm in all habitats and bed material embeddedness and compaction was low to moderate (1 to 2) in most habitats. The only exception was high embeddedness and compaction recorded in the Flat habitat of the Lower Section.

The physical and bed material characteristics of the Lower Section and Upper Section were very similar (Figure 3.13). The apparent differences were D90 (28.3 cm versus 19.7 cm, respectively), percentage of small rock (35% versus 50%, respectively), and percentage of large rock (21% versus 6%, respectively).

These values were indicative of the average rock width being higher in the Lower Section compared to the Upper Section.

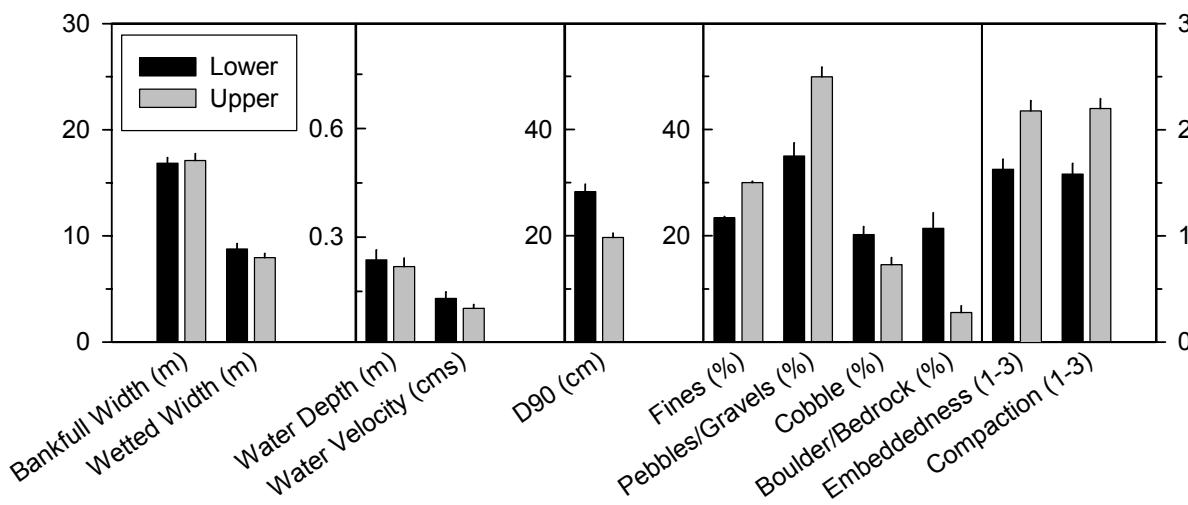

Figure 3.13 Physical and bed material characteristics (mean  $\pm$  SE) of Lower and Upper sections of Farrell Creek, Site C tributaries juvenile fish summer survey 2008 (includes Pool, Run, and Riffle data).

### 3.3.3 Fish Composition, Relative Abundance and Distribution

#### Species Composition

In total, 1258 fish were recorded during the small fish survey in Farrell Creek (Table 3.12). The sample consisted of 12 species, which included 2 sportfish, 2 sucker, 6 minnow, and 2 sculpin species. Sportfish accounted for 7.2% of the total sample. Of the two sportfish encountered, rainbow trout (6.1%) were considerably more abundant than mountain whitefish (1.1%). The sucker group accounted for 29.9% of the total sample. Longnose suckers were most important (21.7%) and largescale suckers were well represented (8.2%). Minnows were the numerically dominant group (61.1% of the total sample). Lake chub (23.8%), longnose dace (21.3%), and redside shiner (11.4%) were the numerically dominant species in the group. The sculpin group (prickly sculpin and slimy sculpin) accounted for 1.8% of the total sample.

Table 3.12 Fish species composition in the Lower and Upper sections of Farrell Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower (n = 3)		Upper (n = 3)		Total	
		Number	Percent	Number	Percent	Number	Percent

	Largescale sucker	68	9.3	35	6.7	103	8.2
	White sucker	0		0		0	
Minnows/ Trout-perch	<i>Subtotal</i>	239	32.7	137	26.0	376	29.9
	Flathead chub	9	1.2	1	0.2	10	0.8
	Lake chub	89	12.2	211	40.1	300	23.8
	Longnose dace	216	29.5	52	9.9	268	21.3
	Northern pikeminnow	18	2.5	28	5.3	46	3.7
	Northern redbelly dace	0		0		0	
	Peamouth	2	0.3	0		2	0.2
	Redside shiner	67	9.2	76	14.4	143	11.4
	Trout-perch	0		0		0	
Sculpins	<i>Subtotal</i>	401	54.8	368	70.0	769	61.1
	Prickly sculpin	13	1.8	1	0.2	14	1.1
	Slimy sculpin	9	1.2	0		9	0.7
	Spoonhead sculpin	0		0		0	
	<i>Subtotal</i>	22	3.0	1	0.2	23	1.8
	<b>Total</b>	<b>732</b>	<b>100.0</b>	<b>526</b>	<b>100.0</b>	<b>1258</b>	<b>100.0</b>
<b>Number of Species</b>		<b>12</b>		<b>10</b>		<b>12</b>	

### Distribution

The species composition was similar between the Lower and Upper sections of Farrell Creek (Table 3.12). There were 12 species found in the Lower Section and 10 species in the Upper Section. Peamouth and slimy sculpin were recorded only in the Lower Section.

### Relative Abundance

In general, fish catch rates were higher in the Lower Section than in the Upper Section (Figure 3.14; Appendix D1). This was particularly true for species that preferred Riffle/Run habitats with cleaner rock materials. Catch rates for species such as rainbow trout, mountain whitefish, longnose sucker, largescale sucker, longnose dace, and both sculpin species were higher in the Lower Section. In contrast, lake chub and redside shiner, species that preferred low water velocity and fine bed materials, were more abundant in the Upper Section. The similar stream characteristics of the Lower and Upper sections (See Tables 3.10 and 3.11) do not support the catch rate results. This apparent contradiction could be explained by the presence of Beaver Impoundments adjacent to sample sites in the Upper Section (habitats that are used by lake chub and redside shiner).

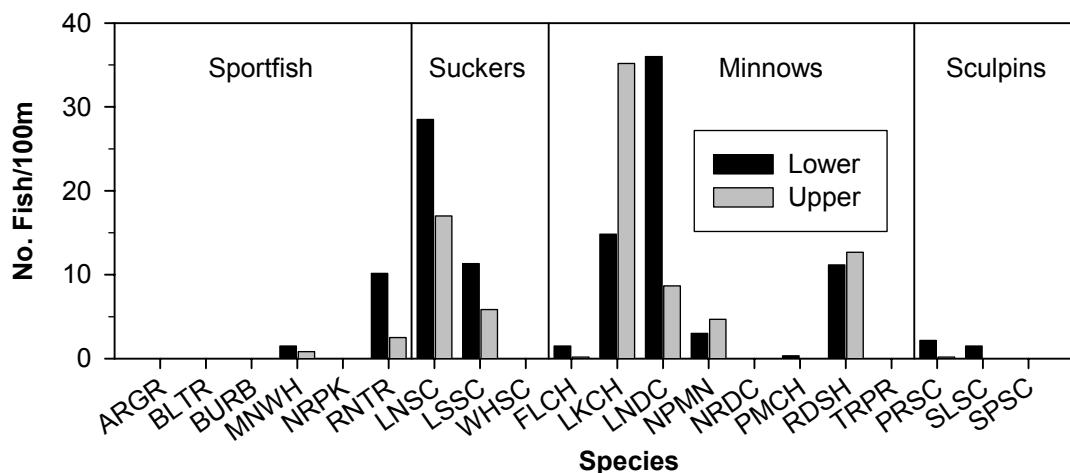

Figure 3.14 Fish catch rates in the Lower and Upper sections of Farrell Creek, Site C tributaries juvenile fish summer survey 2008.

### 3.3.4 Fish Biological Characteristics

The length characteristics of sampled fish from Farrell Creek indicated that large-fish species (rainbow trout, mountain whitefish, longnose sucker, and largescale sucker) were dominated by Age 0 and Age 1 fish (Table 3.13 and Figure 3.15; Appendix F1).

Table 3.13 Length characteristics of fish species sampled from Lower and Upper sections of Farrell Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower (n=3)			Upper (n=3)		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Sportfish	Mountain whitefish	9	57	48 – 63	5	65	60 – 72
	Rainbow trout	61	95	33 – 138	15	100	87 – 128
Suckers	Longnose sucker	46	90.5	28 – 140	15	84	54 – 111
	Largescale sucker	25	70	54 – 95	21	70	30 – 112
Minnows	Flathead chub	9	72	44 – 98	1	80	
	Lake chub	41	66	29 – 82	37	69	53 – 113
	Longnose dace	51	52	20 – 80	22	50.5	24 – 75
	Northern pikeminnow	16	68	51 – 91	21	65	45 – 87
	Peamouth	2	76.5	61 – 92	0		
	Redside shiner	36	59.5	37 – 83	32	56.5	19 – 74
Sculpins	Prickly sculpin	13	62	45 – 100	1	72	
	Slimy sculpin	9	60	48 – 76	0		

Age 0 and Age 1 fish were well represented in the rainbow trout sample, while only Age 0 mountain whitefish were recorded. Samples of both sucker species contained primarily Age 1 fish. Median lengths of rainbow trout were lower in the Lower Section than the Upper Section. The minimum recorded length revealed that no Age 0 fish were recorded in the Upper Section. The sucker group median lengths did not differ considerably from the Lower Section to the Upper Section.

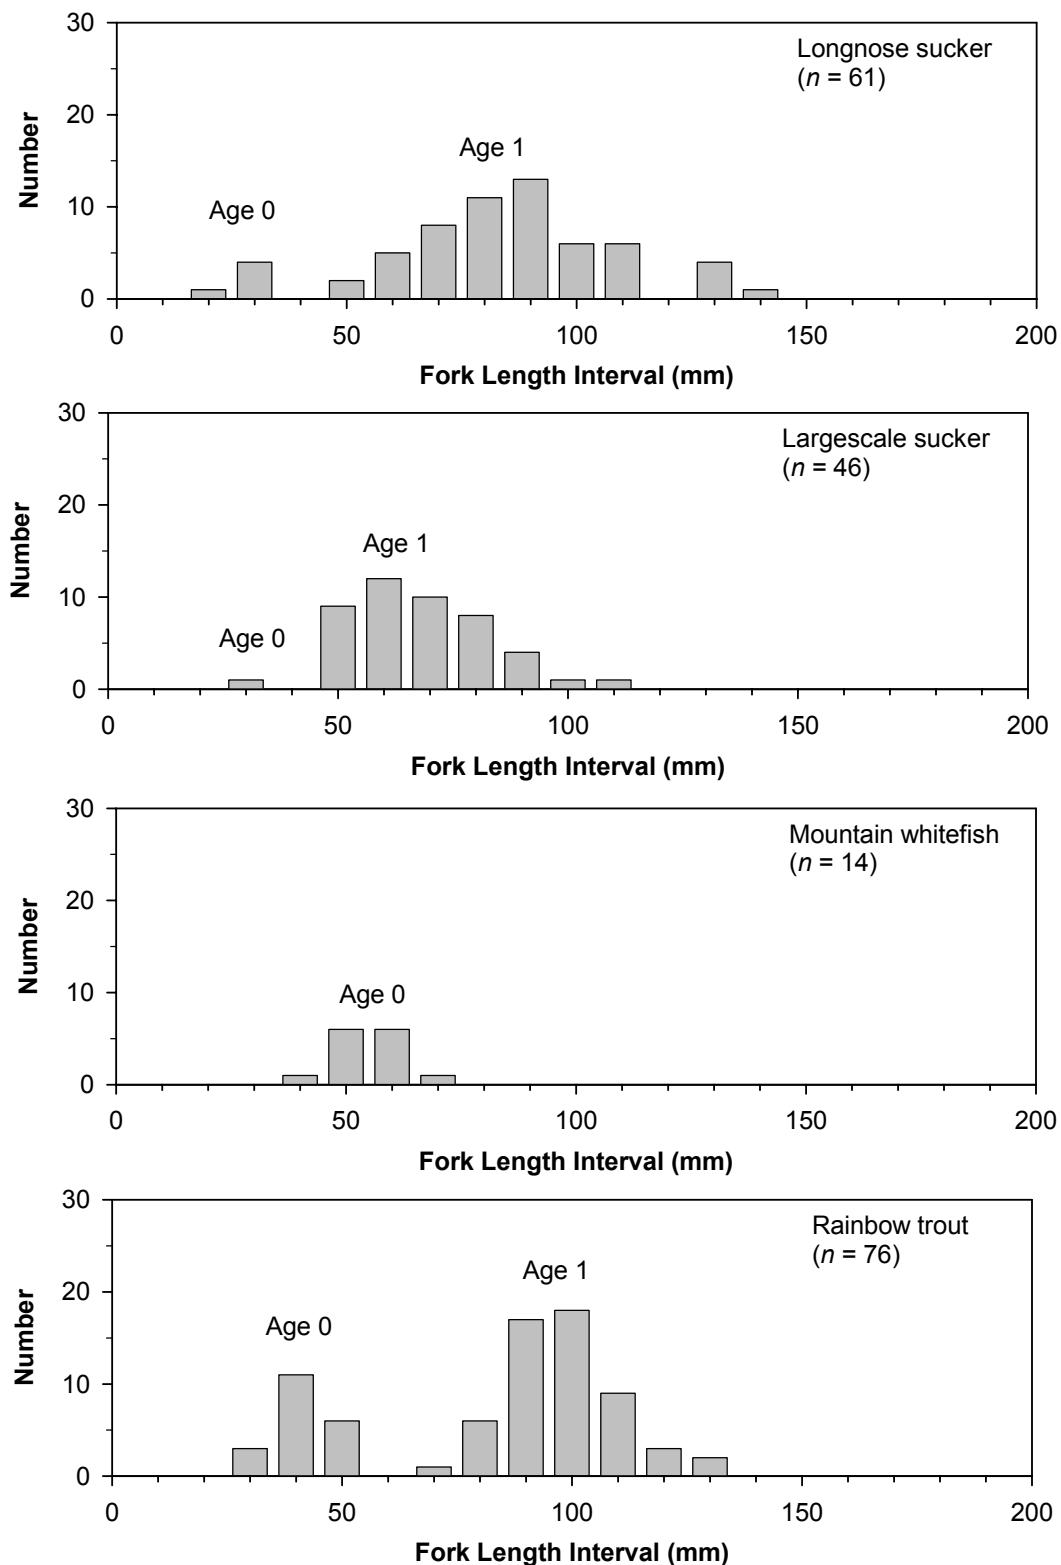

Figure 3.15 Length and age distributions of rainbow trout, mountain whitefish, longnose sucker, and largescale sucker sampled from Farrell Creek, Site C tributaries juvenile fish summer survey 2008 (age designations based on subsample of aged fish and length distributions; data from all sections combined).

## 3.4 HALFWAY RIVER

### 3.4.1 Environmental Characteristics

#### General Water Quality

During the juvenile fish survey average water pH did not differ between the Lower Section and the Upper Section (8.9 versus 8.8, respectively) (Table 3.1; Appendix C1). Average water conductivity was 322  $\mu\text{S}/\text{cm}$  and 344  $\mu\text{S}/\text{cm}$ , respectively. Water clarity was affected by suspended sediments during the program and there were spatial differences. Average water clarity was 45 cm in the Lower Section compared to 88 cm in the Upper Section. This difference may have influenced fish capture results.

#### Water Temperature

Halfway River water temperatures were measured between 21 May and 22 October 2008 (Figure 3.16; Appendix C2D). During that time temperatures ranged between 1.4°C and 18.9°C with an average of 11.4°C. Average daily water temperatures were approximately 7°C at the beginning of the program. Temperatures increased until July and then remained around 15°C until early August. Temperatures then declined to approximately 2.0°C by the end of October when the thermograph was removed.

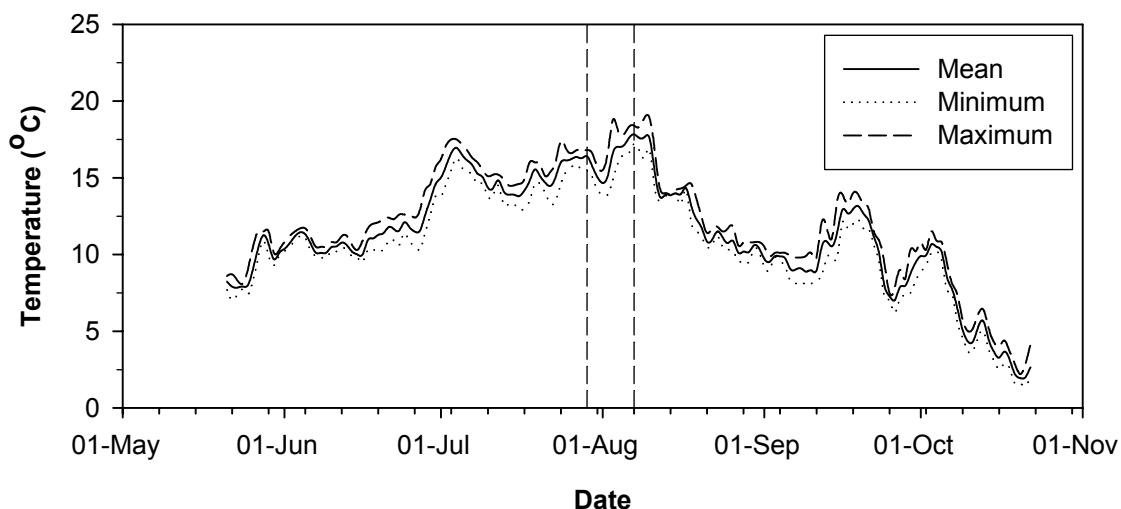

Figure 3.16 Daily water temperatures of Halfway River, Site C tributaries juvenile fish summer survey 2008 (dashed lines represent juvenile fish survey period).

There were minor differences between daily minimum and maximum water temperatures. The maximum range in daily temperature, which occurred in early August, was 3.9°C. Average daily water temperature during the juvenile fish survey period (29 July to 7 August) was 16.3°C (range from 13.9°C to 18.8°C).

### Discharge

Discharge of the Halfway River was continuously monitored by Water Survey of Canada at Station 07FA006 (Figure 3.17). During the period of record (1 May to 31 October), daily discharge ranged between 25.1 m<sup>3</sup>/s and 447.5 m<sup>3</sup>/s. At the start of the program (17 May) discharge was approximately 150 m<sup>3</sup>/s with water flows generally declining to approximately 50 m<sup>3</sup>/s by early August. Following a major rain event on 8 August, discharge rapidly increased to peak at 447.5 m<sup>3</sup>/s on 12 August. It then declined until the end of the monitoring period when measured daily flow was 26.5 m<sup>3</sup>/s. Discharge during the juvenile fish survey field program was not at base flow levels, but it was considered low (daily discharge ranged from 41.4 m<sup>3</sup>/s to 53.7 m<sup>3</sup>/s).

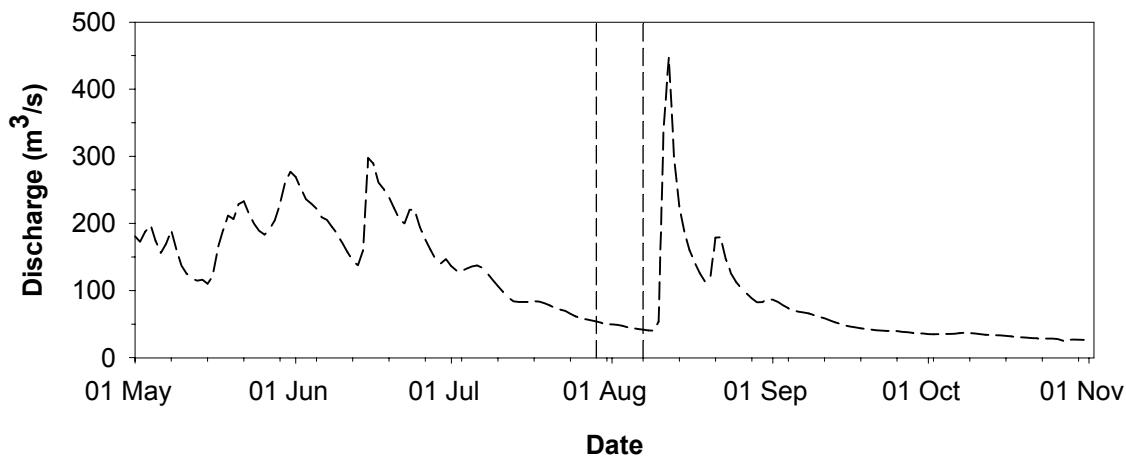

Figure 3.17 Daily discharge of Halfway River, Site C tributaries juvenile fish summer survey 2008. (unedited data from Water Survey of Canada at Station 07FA006; dashed lines represent juvenile fish survey period).

### **3.4.2 Fish Habitat**

The habitat types recorded on the Halfway River depended on the method used and the availability of habitats within each section (Table 3.14; Appendix D2). Of the 63 sampled sites, 9 were located in Back Channels (Plate 7), 4 were in Flats (Plate 8), 5 were in Riffles (Plate 9), and 45 were in Runs (Plate 10).

Table 3.15 summarizes physical characteristics of fish habitats measured at backpack electrofisher and beach seine sites. Habitat characteristics were not measured at boat electrofisher sites (See Section 2.1.2). Back Channel habitats contained a larger percentage of fine bed materials (59%) compared to other habitats ( $\leq 35\%$ ). It should be noted; however, that even with a high percentage of Fines, an average D90 value of 23.3 cm indicated that these sites were subjected to substantial flows at higher discharges.

**Plate 7:** Back Channel on the Halfway River, summer 2008.

**Plate 9:** Riffle-Run complex on the Halfway River, summer 2008.

**Plate 8:** Flat on the Halfway River, summer 2008.

**Plate 10:** Run on the Halfway River, summer 2008.

Table 3.14 Number of sites by habitat and capture method in Lower and Upper sections of the Halfway River, Site C tributaries juvenile fish summer survey 2008.

Section	Capture Method	Habitat Type <sup>a</sup>				
		Back Channel	Flat	Riffle	Run	Total
Lower	Backpack electrofish					
	Beach seine	1	2	2	9	13
	Boat electrofish		2	3	8	13

Upper	Backpack electrofish	2			14	16
	Beach seine	6				6
	Boat electrofish				14	14
	<i>Section Total</i>	8			28	36
<b>Total</b>		<b>9</b>	<b>4</b>	<b>5</b>	<b>45</b>	<b>63</b>

<sup>a</sup> See Appendix B1 for habitat type definitions.

Table 3.15 Physical characteristics of fish habitats (mean  $\pm$  SE) measured at backpack electrofisher and beach seine sites on the Halfway River, Site C tributaries juvenile fish summer survey 2008.

Habitat Type	<i>n</i>	Water Depth (m)	Water Velocity ( $m^3/s$ )	D90 (cm)	Bed Material Type (%)				Condition	
					Fines	PE/GR	CO	BO/BE	Embedd.	Compact.
Back Channel	9	$0.38 \pm 0.06$	0	$23.3 \pm 5.0$	$59 \pm 14$	$17 \pm 8$	$20 \pm 7$	$4 \pm 2$	$2.2 \pm 0.3$	$2.4 \pm 0.3$
Flat	2	$0.20 \pm 0.00$	$0.13 \pm 0.10$	$26.5 \pm 4.5$	$35 \pm 5$	$30 \pm 0$	$5 \pm 5$	$3.0 \pm 0.0$	$3.0 \pm 0.0$	$2.5 \pm 0.5$
Riffle	2	$0.22 \pm 0.03$	$0.28 \pm 0.08$	$21.1 \pm 1.0$	$3 \pm 3$	$13 \pm 3$	$68 \pm 13$	$18 \pm 13$	$1.0 \pm 0.0$	$2.0 \pm 1.0$
Run	23	$0.33 \pm 0.15$	$0.19 \pm 0.03$	$22.4 \pm 2.5$	$13 \pm 4$	$43 \pm 5$	$34 \pm 4$	$10 \pm 2$	$1.9 \pm 0.2$	$2.2 \pm 0.2$

Average water velocities were low (<0.20 m/s) in most habitats except Riffles. Most habitats except Back Channel were dominated by Pebbles/Gravels and Cobbles. Embeddedness and compaction were highest in Flat habitat.

There were sufficient samples from Run habitat to compare physical characteristics of the Lower Section (*n* = 9) and the Upper Section (*n* = 14). Several characteristics of sampled Run habitats differed between sections (Figure 3.18). The Lower Section exhibited higher water depths and lower water velocities. In addition, D90 was lower (17.7 cm versus 25.7 cm) and there was a much large percentage of Fines (23% versus 6%, respectively). Finally, both embeddedness and compaction were higher in the Lower Section compared to the Upper Section. These results likely reflect differences in the overall river characteristics (e.g., gradient), which may facilitate sedimentation. In addition, suspended sediment loads may be higher in the Lower Section due to inputs from a large slide located at Km 17 (Plate 11).

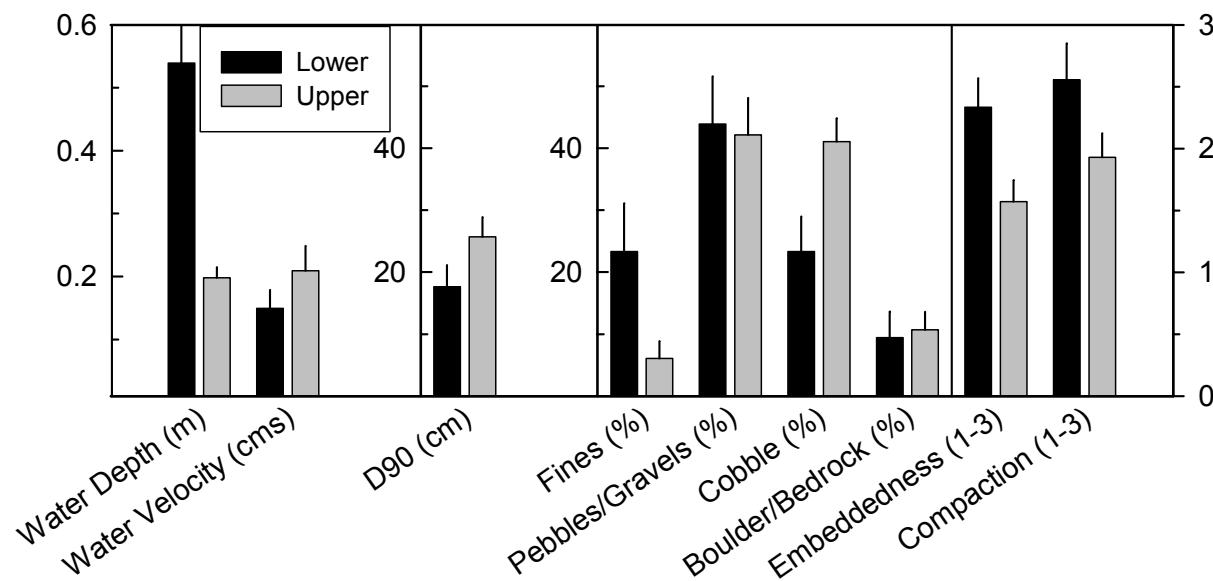

Figure 3.18 Physical and bed material characteristics (mean  $\pm$  SE) of Lower and Upper sections of the Halfway River, Site C tributaries juvenile fish summer survey 2008 (includes Run data).

**Plate 11:** Slide at Km 17 on the Halfway River,  
summer 2008.

### 3.4.3 Fish Composition, Distribution and Relative Abundance

#### Species Composition

In total, 4945 fish were recorded during the small fish survey on the Halfway River (Table 3.16). The sample consisted of 18 species, which included 6 sportfish, 2 suckers, 6 minnows, 1 trout-perch, and 3 sculpin species. Sportfish accounted for a small percentage of the total sample (3.8%). Mountain whitefish was the only sportfish species in the group that could be considered numerous (2.7%). All other sportfish species were scarce (<1.0%).

Suckers accounted for a little less than one third of the total sample (26.7%). Longnose sucker was the most abundant sucker species (16.7%), although largescale suckers were well represented (9.9%). White sucker was absent from the small fish sample in the Halfway River.

Minnows accounted for the largest percentage of the total sample (66.9%) and redside shiner was the numerically dominant species (46.6%). Other numerically important minnow species included lake chub (10.7%) and longnose dace (7.0%). The sculpin group accounted for only 2.6% of the total sample. Of the three species recorded, slimy sculpin was the dominant species (2.1%).

#### Distribution

The number of species recorded in the Lower Section and Upper Section of the Halfway River were similar (14 species versus 18 species, respectively) (Table 3.16). The difference in number was caused by the absence of three sportfish species (Arctic grayling, bull trout, and northern pike) and trout-perch from the Lower Section.

Table 3.16 Fish species composition in Lower and Upper sections of the Halfway River, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower		Upper		Total	
		Number	Percent	Number	Percent	Number	Percent
Sportfish	Arctic grayling	0		25	0.8	25	0.5
	Bull trout	0		17	0.5	17	0.3

<b>Total</b>		<b>1076</b>	<b>100.0</b>	<b>3869</b>	<b>100.0</b>	<b>4945</b>	<b>100.0</b>
<b>Number of Species</b>		<b>14</b>		<b>18</b>		<b>18</b>	

Relative Abundance

The three gear types used during the survey of the Halfway River were effective fish capture methods, but gear type catch rates varied according to fish group or species (Figure 3.19; Appendix E1, E2, and E3). Greatest numbers of sportfish were encountered using boat electrofisher. Suckers and minnows were recorded using all three methods, but boat electrofisher and backpack electrofisher appeared to be most effective in terms of numbers of fish captured. The only exceptions were lake chub and redside shiner, which were more abundant in the beach seine catch. Sculpins were recorded in the backpack electrofisher and boat electrofisher catches, but were completely absent from the beach seine catch.

Longnose sucker, largescale sucker, and redside shiner were the dominant species in the boat electrofisher sample with average catch rates >10 fish/km. Mountain whitefish was the only prominent sportfish, but average catch rates did not exceed 5 fish/km. The catch of redside shiners in the beach seine sample suggested very high abundance; however, this value was caused by data from a single site (882 fish/100 m<sup>2</sup>, Appendix E3). Longnose dace dominated the backpack electrofisher catch (>10 fish/100 m), while several other species exhibited catch rates that ranged between 1.5 fish/100 m

and 4 fish/100 m. These included longnose sucker, largescale sucker, lake chub, redside shiner, and slimy sculpin.

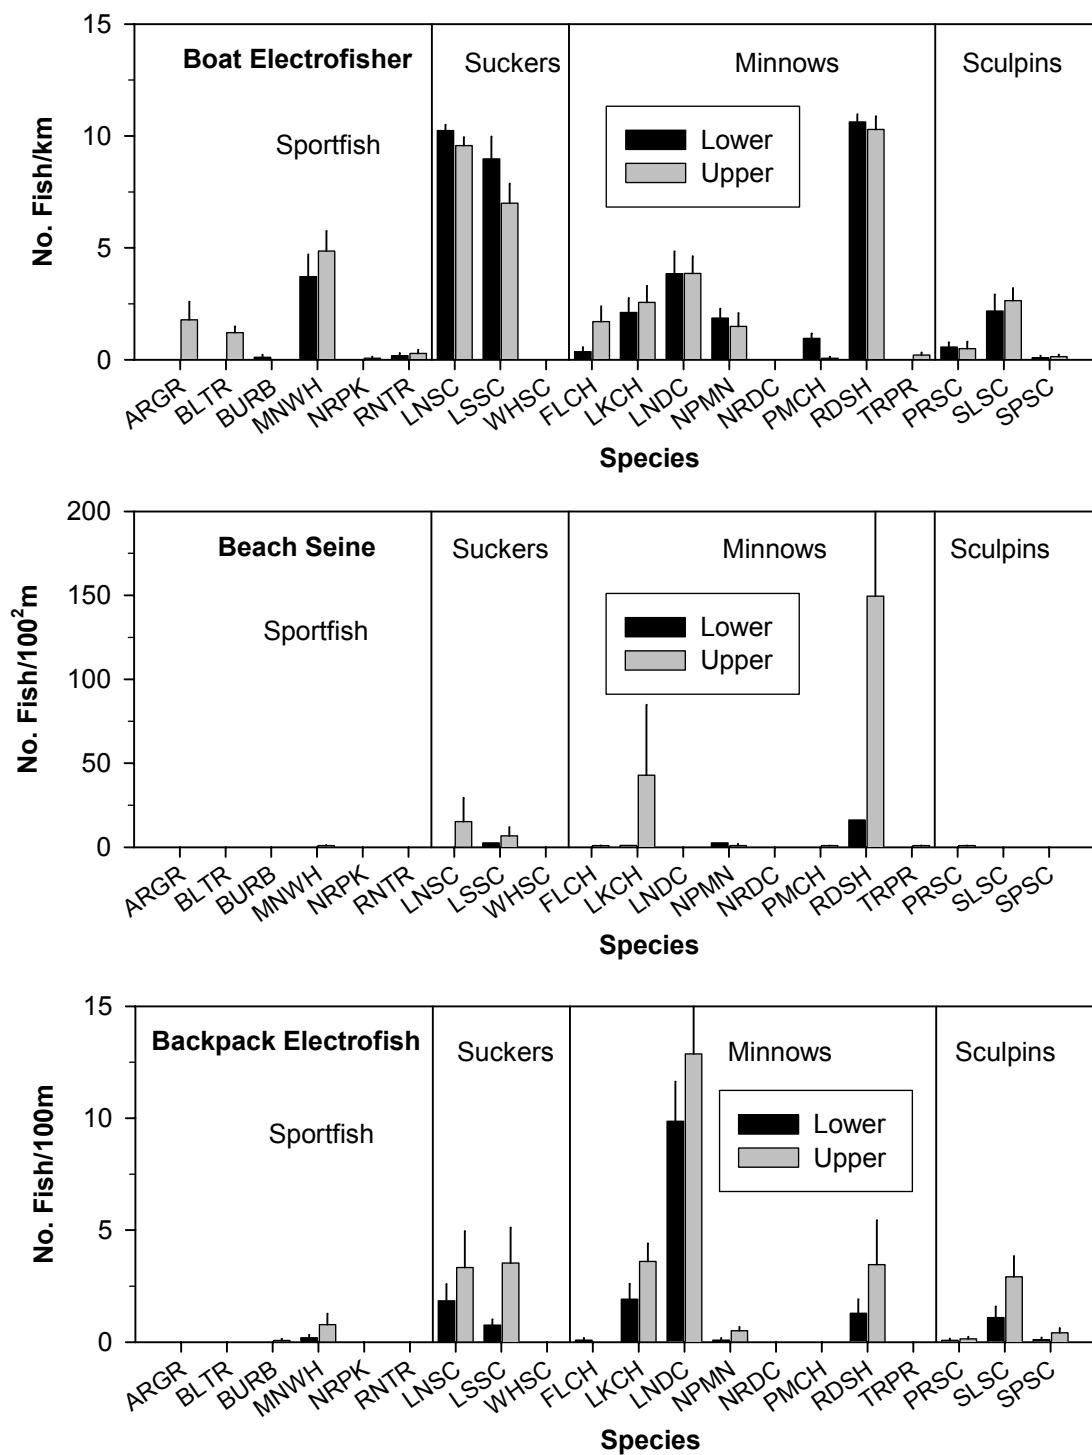

Figure 3.19 Mean catch rates of fish species using three capture methods in Lower and Upper sections of the Halfway River, Site C tributaries juvenile fish summer survey 2008.

Results presented in Figure 3.19 suggested spatial differences in fish abundance. Boat electrofisher, beach seine, and backpack electrofisher catch rates for most species were higher in the Upper Section compared to the Lower Section. This potential trend should be interpreted with caution. During the survey, water clarity was higher in the Upper Section compared to the Lower Section (Table 3.1). Differences in water clarity have been shown to affect capture efficiency of electrofishers (Reynolds 1996, Speas *et al.* 2004). As such, higher water clarity could explain higher catch rates in the Upper Section using electrofishers. In addition, the beach seine results from the Upper Section included very high catch rates at a single site (Site HABS01, Appendix E3), which biased the data.

#### Habitat Preference

The backpack electrofisher catch rate data were used to examine habitat preference by fish (Table 3.17). Fish catch rates were not significantly correlated with water depth or water velocity. Catch rates of most species were positively correlated with D90 and these correlations were statistically significant for four species (lake chub, largescale sucker, redside shiner, and slimy sculpin). Positive correlations were also recorded between catch rate and percent rock, but the relationships were significant only for longnose dace and slimy sculpin. Both embeddedness and compaction were negatively correlated with catch rate. The correlations for compaction were significant for most species except longnose dace. These results suggested that sedimentation had a negative influence on habitat preference by these species.

Table 3.17 Correlation between backpack electrofisher catch rate and habitat parameters for selected fish species in the Halfway River, Site C tributaries fisheries summer survey 2008.

Species	Pearson Correlation Coefficient and Significance <sup>a, b</sup>					
	Depth (m)	Velocity (m/s)	D90 (cm)	Embedd.	Compact.	Percent Rock
Lake chub	-0.015	-0.216	<b>0.471*</b>	-0.251	<b>-0.428*</b>	0.268

<sup>a</sup> Significance accepted at P ≤ 0.10 and designated by an asterisk.

<sup>b</sup> Includes sites designated as Run, Flat, or Riffle habitat; sample size equals 27.

#### 3.4.4 Fish Biological Characteristics

Sampled fish from the Halfway River indicated that large-fish species (Arctic grayling, mountain whitefish, longnose sucker, and largescale sucker) were dominated by Age 0 and Age 1 fish (Table 3.18 and Figure 3.20; Appendix F1). In the sportfish group, Arctic grayling were composed almost entirely of Age 1 fish while mountain whitefish were equally represented by Age 0 and Age 1. Sample

sizes available for other sportfish species were too small to indicate age distributions, but median lengths suggested the presence of Age 1 or older bull trout, burbot, northern pike and rainbow trout. Longnose sucker and largescale sucker samples exhibited wide length distributions, which suggested the presence of multiple age classes. Modal peaks for both species indicated strong representation by Age 1 fish. Age 0 fish were present but were scarce.

Table 3.18 Length characteristics of fish species sampled from the Lower and Upper sections of the Halfway River, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower			Upper		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Sportfish	Arctic grayling	0			25	101	85 - 167
	Bull trout	0			4	183	173 - 185

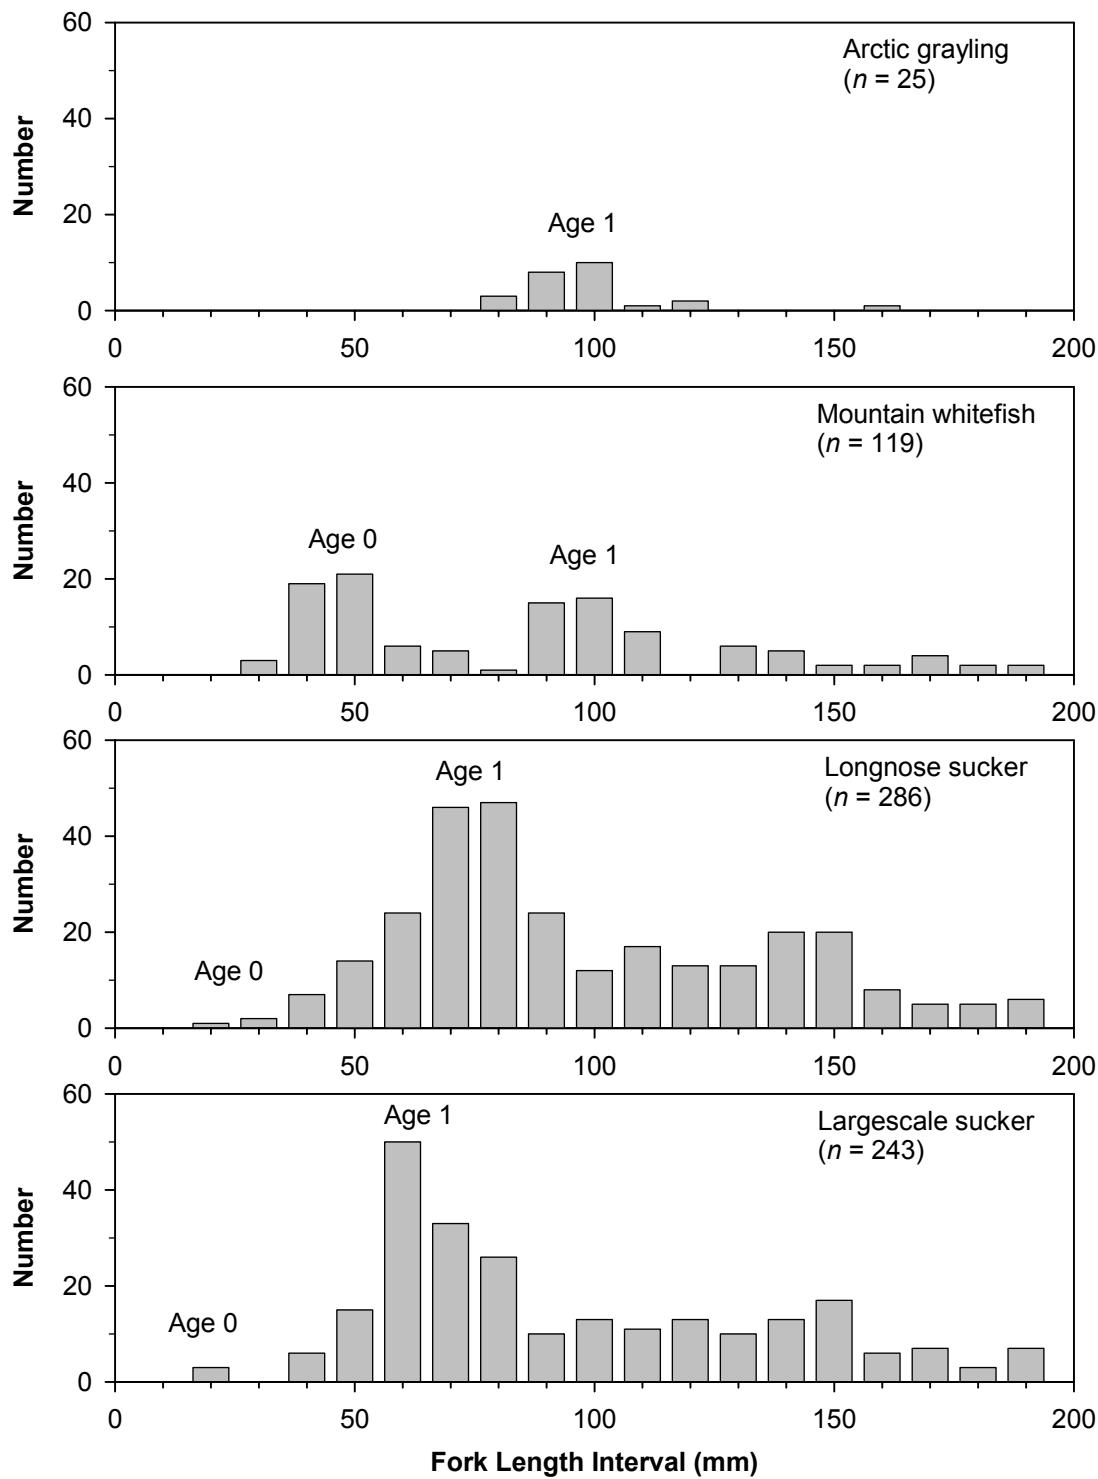

Figure 3.20 Length distributions of selected species sampled from the Halfway River, Site C tributaries juvenile fish survey 2008 (age designations based on subsample of aged fish and length distributions; data from all sections combined).

## 3.5 CACHE CREEK

### 3.5.1 Environmental Characteristics

#### General Water Quality

During the juvenile fish survey average water pH was 8.1 in the Lower Section and 8.0 in the Upper Section (Table 3.1; Appendix C1). Average water conductivity was very high (991  $\mu\text{S}/\text{cm}$  and 1186  $\mu\text{S}/\text{cm}$  in the Lower and Upper Section, respectively). Water clarity was to the channel bottom and was considered moderate to high during the fish survey.

#### Water Temperature

Cache Creek water temperatures were monitored between 21 May and 12 October 2008 (Figure 3.21; Appendix C2E). During that time temperatures ranged between 4.3°C and 26.9°C with an average of 16.0°C. Average daily water temperatures were approximately 14°C at the beginning of the monitoring program (17 May). They increased during June through to July and then remained high (approximately 20°C) until the middle of August. Water temperatures then declined until early October when the thermograph was removed.

There was a large range in daily water temperatures, particularly during the warmest months of July and August. During this period the range in diel water temperature was as high as 10.0°C. Water temperatures exceeded 22°C on 49 days during the summer.

Average daily water temperature during the juvenile fish survey was high (20.0°C) (range from 14.6°C to 25.9°C).

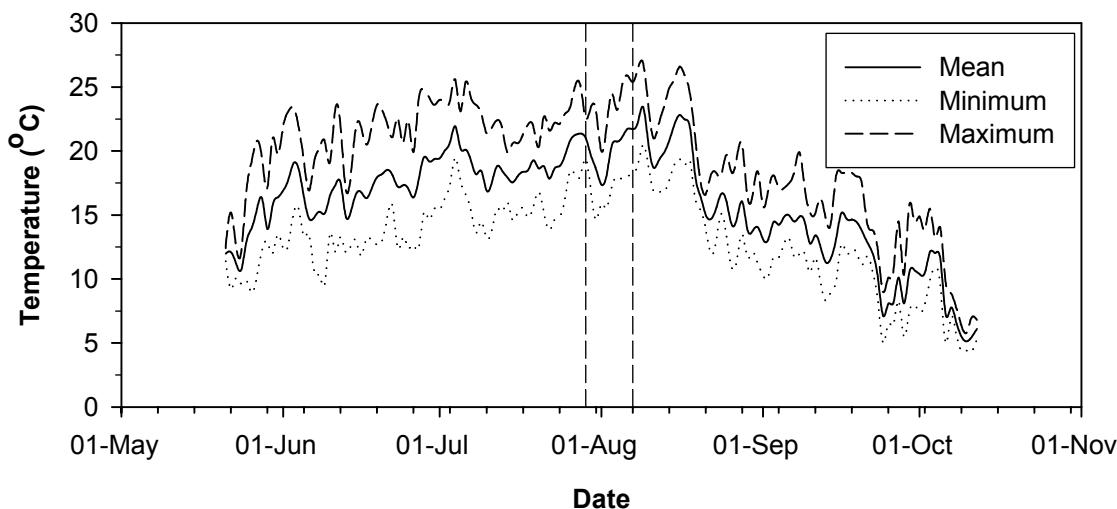

Figure 3.21 Daily water temperatures of Cache Creek, Site C tributaries juvenile fish survey 2008 (dashed lines represent juvenile fish survey period).

### Discharge

Discharge of Cache Creek was measured during spring freshet, and during base flows in summer and fall (Figure 3.22; Appendix C3). Measured discharge ranged from 0.6 m<sup>3</sup>/s to 1.8 m<sup>3</sup>/s during the spring period (17 May to 5 June). Water flows declined substantially by summer. Recorded discharge was 0 m<sup>3</sup>/s on 3 August and 11 October in the same section of stream as the spring.

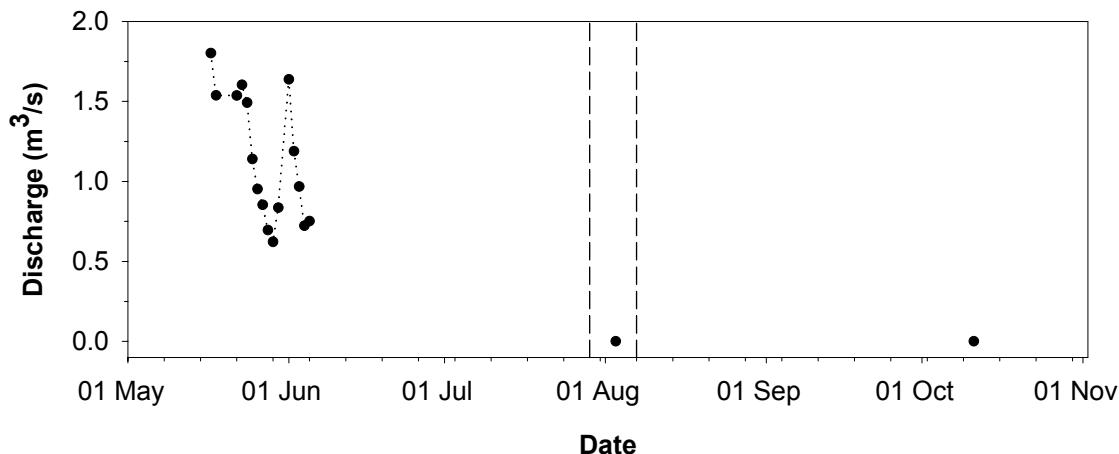

Figure 3.22 Measured discharge of Cache Creek, Site C tributaries juvenile fish survey 2008 (points represent measurements; dashed lines represent juvenile fish survey period).

### 3.5.2 Fish Habitat

Sampling of Cache Creek occurred during zero surface water flow, which affected the results of the survey. The major habitat types recorded at sampled sites on Cache Creek were Pools, Riffles, and Runs (Table 3.19; Plates 12 and 13; Appendix D1). Other recorded habitats included two Flats in the Lower Section.

Table 3.19 Physical characteristics of fish habitats (mean ± SE) in Upper and Lower sections of Cache Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	n	Bankfull Width (m)	Wetted Width (m)	Water Depth (m)	Water Velocity (m <sup>3</sup> /s)
Lower (n=4)	Flat	2	20.2 ± 2.2	3.7 ± 0.5	0.60 ± 0.46	0.00
	Pool	23	11.7 ± 0.7	5.6 ± 0.4	0.39 ± 0.05	0.00
	Riffle	22	15.6 ± 1.0	5.6 ± 0.8	0.04 ± 0.01	0.01 ± 0.01
	Run	23	13.3 ± 0.8	5.2 ± 0.6	0.19 ± 0.05	0.00
	Average <sup>a</sup>	68	13.5 ± 0.5	5.5 ± 0.3	0.21 ± 0.03	<0.01
Upper (n=3)	Flat	0				
	Pool	18	11.2 ± 0.8	5.3 ± 0.4	0.33 ± 0.03	0.00
	Riffle	18	11.6 ± 1.3	4.9 ± 0.7	0.06 ± 0.02	0.05 ± 0.02
	Run	16	11.9 ± 0.9	5.8 ± 0.7	0.14 ± 0.02	0.01 ± 0.01
	Average <sup>a</sup>	52	11.5 ± 0.6	5.3 ± 0.3	0.18 ± 0.02	0.02 ± 0.01

<sup>a</sup> Includes data from Pool, Run, and Riffle.

**Plate 12:** Riffle-Run complex in Cache Creek, summer 2008.

**Plate 13:** Isolated Pool in Cache Creek, summer 2008.

Wetted channel width was approximately 40% of bankfull width, water depth averaged less than 0.20 m, and water velocities were generally nil. As expected, Pool habitats exhibited greater water depths (approximately 0.30 to 0.40 m), as did Flat habitat (approximately 0.60 m).

Fines dominated the bed material in most habitats (Table 3.20). Riffle and Run habitats had higher percentages of Pebble/Gravel and Cobble. Bed material embeddedness and compaction was low to moderate (1 to 2) in most habitats.

Table 3.20 Bed material characteristics of fish habitats in Upper and Lower sections of Cache Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	<i>n</i>	D90 (cm)	Bed Material Type (%)				Substrate Condition	
				Fines	PE/GR	CO	BO/BE	Embedd.	Compact.
Lower (n=4)	Flat	2	30.5 ± 12.5	40	20	20	20	2.0	2.5 ± 0.5
	Pool	23	12.8 ± 3.1	58 ± 3	22 ± 3	17 ± 1	4 ± 1	2.6 ± 0.1	1.3 ± 0.1
	Riffle	22	20.3 ± 3.8	34 ± 3	31 ± 3	23 ± 2	12 ± 2	1.4 ± 0.2	1.8 ± 0.2
	Run	23	15.5 ± 2.4	45 ± 3	28 ± 3	20 ± 2	7 ± 2	2.4 ± 0.1	1.7 ± 0.1
	Average <sup>a</sup>	68	16.2 ± 1.8	46 ± 1	27 ± 2	20 ± 1	8 ± 1	2.1 ± 0.1	1.6 ± 0.1

	Run	16	17.8 ± 1.7	41 ± 2	19 ± 2	24 ± 1	16 ± 1	2.3 ± 0.1	1.8 ± 0.1
	Average <sup>a</sup>	52	17.3 ± 1.0	42 ± 1	20 ± 1	24 ± 1	14 ± 1	2.1 ± 0.1	1.7 ± 0.1

<sup>a</sup> Includes data from Pool, Run, and Riffle.

The physical and bed material characteristics of the Upper Section and Lower Section were very similar (Figure 3.23).

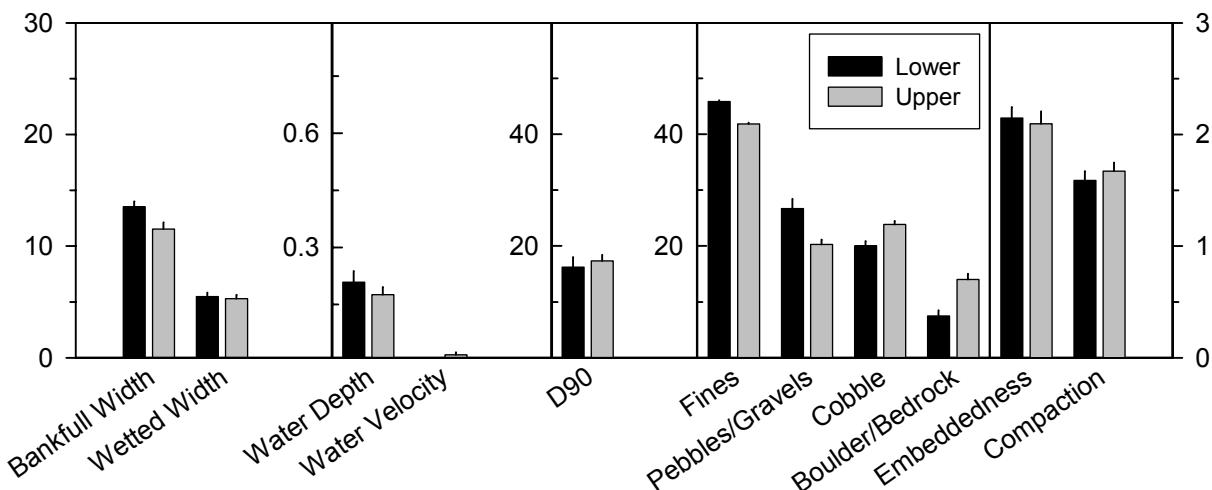

Figure 3.23 Physical and bed material characteristics (mean  $\pm$  SE) of Lower and Upper sections of Cache Creek, Site C tributaries juvenile fish summer survey 2008 (includes Pool, Run, and Riffle data).

### 3.5.3 Fish Composition, Relative Abundance and Distribution

#### Species Composition

In total, 3889 fish were recorded during the small fish survey in Cache Creek (Table 3.21). The sample consisted of 11 species, which included 1 sportfish, 3 sucker, 5 minnow, and 2 sculpin species. Only one sportfish, a single mountain whitefish, was recorded. Suckers accounted for 15.1% of the total sample. Longnose sucker was the most important (12.7%), followed by largescale sucker (2.2%), and white sucker (0.2%). It should be noted that white sucker was only recorded in this tributary. Minnows accounted for the majority of the total sample (84.6%); lake chub accounted for most of these fish (54.7%). Longnose dace (27.3%) and redside shiner (2.6%) were well represented, with the remaining species (northern pikeminnow and peamouth) being scarce (<0.3% of the total sample). Sculpins were uncommon (<0.3% of the total sample).

#### Distribution

The number of fish species was similar between the Lower Section and Upper Section of Cache Creek (Table 3.21). There were 10 species caught in the Lower Section and 7 in the Upper Section. This was due to only one specimen caught of each of mountain whitefish, northern pikeminnow, and spoonhead sculpin species in the Lower Section and none in the Upper Section. Prickly sculpin was only recorded in the Lower Section. One peamouth was caught in the Upper Section.

Relative Abundance

Lake chub was the most abundant species in Cache Creek, followed by longnose dace and longnose sucker (Figure 3.24; Appendix E1) Species catch rates did not indicate consistent spatial trends.

Table 3.21 Fish species composition in the Lower and Upper sections of Cache Creek, Site C tributaries juvenile fish summer survey 2008.

### 3.5.4 Fish Biological Characteristics

Large-fish species (mountain whitefish, longnose sucker and largescale sucker) were dominated by Age 0 and Age 1 fish (Table 3.22 and Figure 3.25; Appendix F1). The single mountain whitefish was Age 0.

Table 3.22 Length characteristics of fish species sampled from the Lower and Upper sections of Cache Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower			Upper		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Sportfish	Mountain whitefish	1	57		0

## 3.6 RED CREEK

### 3.6.1 Environmental Characteristics

Water quality values for pH were 7.5 in the Lower Section and 7.2 in the Upper Section of Red Creek (Table 3.1; Appendix C1). Conductivity was extremely high, 2068 µS/cm in the Lower Section and 2450 µS/cm in the Upper Section. Visual observations indicated high iron content (Plate 14).

Water temperature and discharge were not recorded in Red Creek during the field program. These parameters were very similar to Cache Creek conditions. Water temperatures likely were warm and surface water flow was zero.

### 3.6.2 Fish Habitat

Surface water flow was zero during the survey period. The major habitat types recorded at sampled sites on Red Creek were Pools, Riffles, and Runs (Table 3.23; Plate 14; Appendix D1).

Table 3.23 Physical characteristics of fish habitats (mean ± SE) in Lower and Upper sections of Red Creek, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type <sup>a</sup>	n	Bankfull Width (m)	Wetted Width (m)	Water Depth (m)	Water Velocity (m <sup>3</sup> /s)

<sup>a</sup> Assumes presence during periods of water flow.

<sup>b</sup> Includes data from Pool, Run, and Riffle.

Wetted channel width was approximately 35% of bankfull width, water depth was very low, and water velocities were generally nil. Fines dominated the bed material in all habitats; embeddedness and compaction was moderate to high (Table 3.24).

The physical and bed material characteristics of the Upper Section and Lower Section were very similar (Figure 3.26).

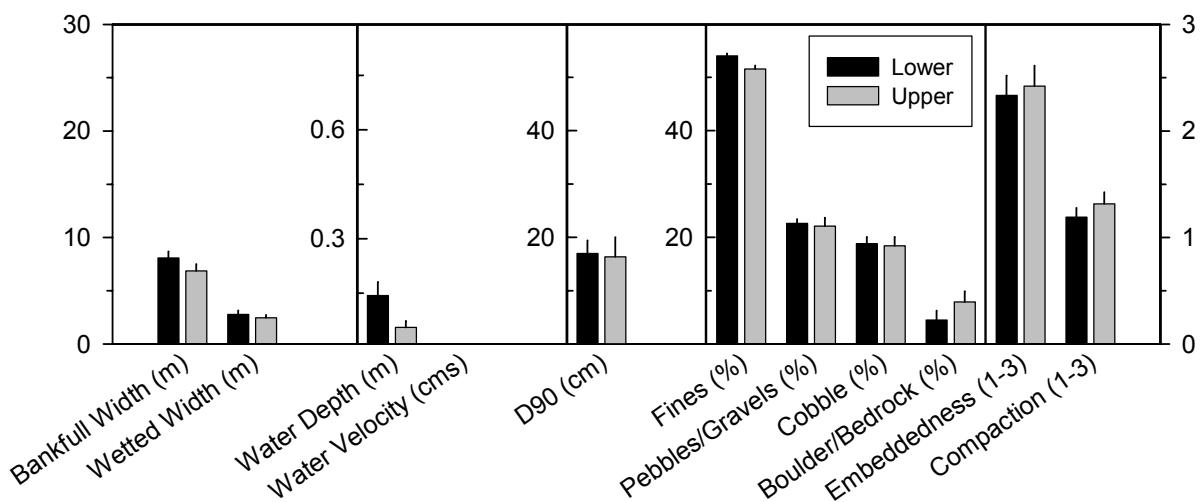

Figure 3.26 Physical and bed material characteristics (mean  $\pm$  SE) of the Lower and Upper sections of Red Creek, Site C tributaries juvenile fish summer survey 2008 (includes Pool, Run, and Riffle data).

### 3.6.3 Fish Composition, Relative Abundance and Distribution

#### Species Composition and Distribution

In total, 87 fish were recorded during the small fish survey in Red Creek (Table 3.25). Only 2 species were recorded. Longnose sucker represented 14.9% of the total sample, whereas lake chub dominated numerically at 85.1%. All fish were recorded in the Lower Section.

Table 3.25 Fish species composition in the Lower and Upper sections of Red Creek, Site C tributaries juvenile fish summer survey 2008.

Species	Lower ( <i>n</i> = 1)		Upper ( <i>n</i> = 1)		Total	
	Number	Percent	Number	Percent	Number	Percent
Longnose sucker	13	14.9	0	0.0	13	14.9
Lake chub	74	85.1	0	0.0	74	85.1
<b>Total</b>	<b>87</b>	<b>100.0</b>	<b>0</b>	<b>0.0</b>	<b>87</b>	<b>100.0</b>
<b>Number of Species</b>	<b>2</b>		<b>0</b>		<b>2</b>	

#### Relative Abundance

Lake chub abundance in the Lower Section was 37.0 fish/100 m (Appendix E1). Longnose sucker catch rates were also considered high (6.5 fish/100 m).

### 3.6.4 Fish Biological Characteristics

The length characteristics of large-fish species (longnose sucker) populations were dominated by Age 0 fish (Table 3.26; Appendix F1), with lengths ranging from 25 to 34 mm.

Table 3.26 Length characteristics of fish species sampled from the Lower Section of Red Creek, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower			Upper		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Suckers	Longnose sucker	10	30.5	25 – 34	0		
Minnows	Lake chub	10	66.0	38 - 89	0		

## 3.7 WILDER CREEK

Wilder Creek was examined on 7 August. At that time there was no surface water flow and there was standing water in the channel within 100 m of the confluence with the Peace River. As such, no further assessment of Wilder Creek was undertaken.

## 3.8 MOBERLY RIVER

### 3.8.1 Environmental Characteristics

#### General Water Quality

During the juvenile fish survey average water pH was 8.8 in the Lower Section and 8.7 in the Upper Section (Table 3.1; Appendix C1). Average water conductivity was 206 µS/cm and 201 µS/cm, respectively. Water clarity of the Moberly River was to the channel bottom and was considered high during the survey.

#### Water Temperature

Moberly River water temperatures were monitored between 22 May and 26 October 2008 (Figure 3.27; Appendix C2F). During that time temperatures ranged between -0.0°C and 24.7°C with an average of 13.6°C. Average daily water temperatures were approximately 11°C at the beginning of the monitoring program (17 May). They increased during June through to July and then remained high (approximately 19°C) until the middle of August. Water temperatures then declined until October when the thermograph was removed.

There was a large difference between daily minimum and maximum water temperatures of the Moberly River, particularly during the warmest months of July and August. During this period the range in daily temperature was as high as 8.5°C. Water temperatures exceeded 22°C on 16 days during the summer.

Average daily water temperature during the survey was 18.6°C (range from 14.0°C to 23.9°C).

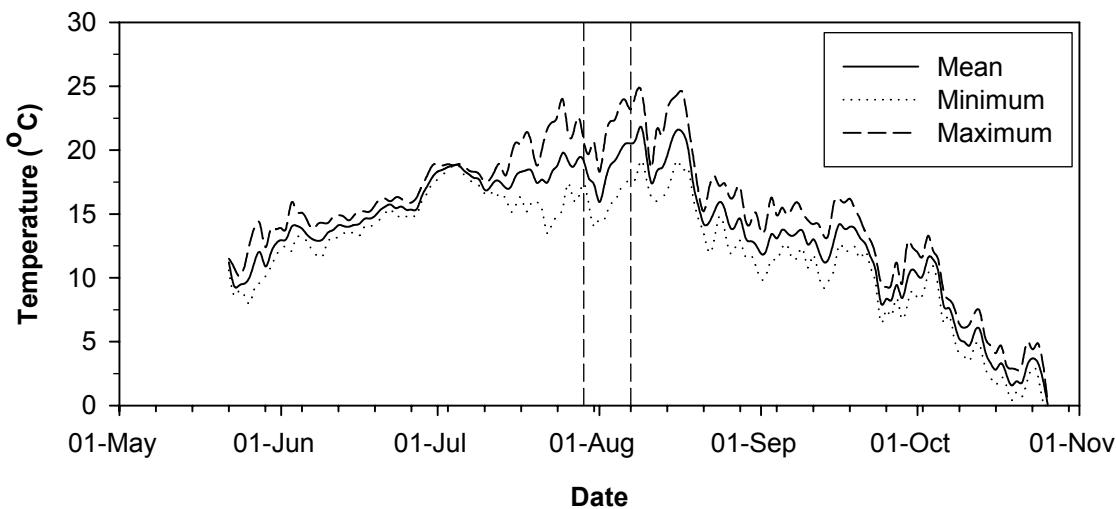

Figure 3.27 Daily water temperatures of Moberly River, Site C tributaries juvenile fish summer survey 2008 (dashed lines represent juvenile fish survey period).

#### Discharge

Discharge of the Moberly River was continuously monitored from the Water Survey of Canada Station 07FB008 (Figure 3.28). Discharge increased from 8.5 m<sup>3</sup>/s to 80.3 m<sup>3</sup>/s between early May and early June. Water flows then rapidly declined until early August. Average monthly discharge was 39.8 m<sup>3</sup>/s in May, 44.0 m<sup>3</sup>/s in June, 10.4 m<sup>3</sup>/s in July, 3.6 m<sup>3</sup>/s in August, and 3.0 m<sup>3</sup>/s in September.

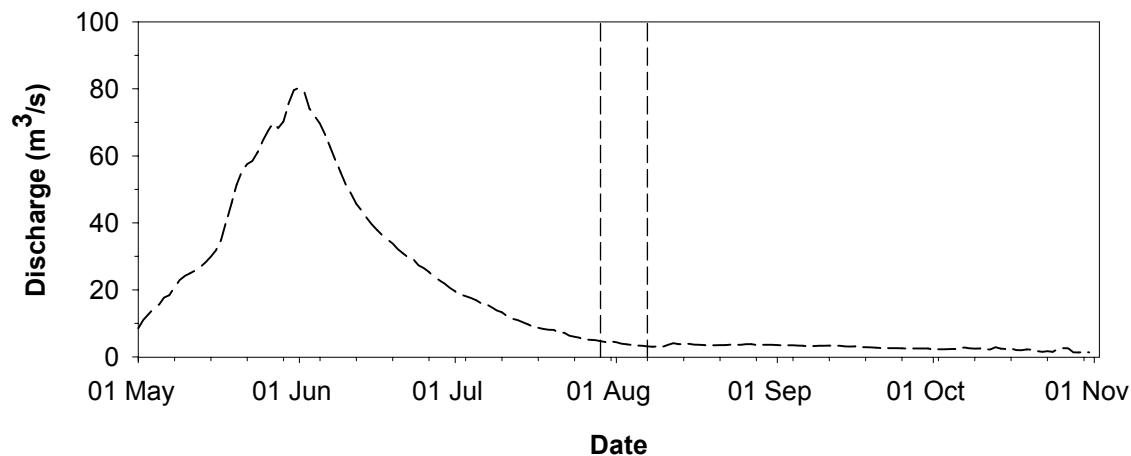

Figure 3.28 Discharge of the Moberly River, Site C tributaries juvenile fish summer survey 2008 (unedited data from Water Survey of Canada at Station 07FB008; dashed lines represent juvenile fish survey period).

### 3.8.2 Fish Habitat

The major habitat types recorded at sampled sites on the Moberly River were Pools, Riffles, and Runs (Table 3.27; Plates 15 and 16; Appendix D1). Other habitats recorded included two Flats and one Rapid in the Lower Section and one Rapid in the Upper Section.

Table 3.27 Physical characteristics of fish habitats (mean  $\pm$  SE) in Lower and Upper sections of the Moberly River, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	n	Bankfull Width (m)	Wetted Width (m)	Water Depth (m)	Water Velocity ( $m^3/s$ )
Lower (n=7)	Flat	2	65.0 $\pm$ 9.0	6.3 $\pm$ 3.9	0.42 $\pm$ 0.18	0.06 $\pm$ 0.05
	Pool	22	23.4 $\pm$ 4.0	6.1 $\pm$ 0.7	0.38 $\pm$ 0.03	0.09 $\pm$ 0.02
	Riffle	31	24.2 $\pm$ 3.4	7.5 $\pm$ 1	0.11 $\pm$ 0.01	0.39 $\pm$ 0.04
	Run	33	28.0 $\pm$ 5.1	6.9 $\pm$ 0.8	0.21 $\pm$ 0.03	0.28 $\pm$ 0.04
	Rapid	1	40.0	8.8	0.65	0.60
	Average <sup>a</sup>	86	25.4 $\pm$ 2.5	6.9 $\pm$ 0.5	0.22 $\pm$ 0.02	0.27 $\pm$ 0.02
Upper (n=8)	Flat	0				
	Pool	22	31.3 $\pm$ 4.7	9.8 $\pm$ 1.1	0.49 $\pm$ 0.04	0.26 $\pm$ 0.06
	Riffle	30	28.4 $\pm$ 3.9	12.2 $\pm$ 1.3	0.20 $\pm$ 0.02	0.55 $\pm$ 0.04
	Run	37	31.1 $\pm$ 3.2	12.6 $\pm$ 1.2	0.36 $\pm$ 0.02	0.32 $\pm$ 0.04
	Rapid	1	26.8	15.6	0.37	0.85
	Average <sup>a</sup>	89	30.3 $\pm$ 2.2	11.8 $\pm$ 0.7	0.34 $\pm$ 0.02	0.38 $\pm$ 0.03

<sup>a</sup> Includes data from Pool, Run, and Riffle.

Wetted channel width was much less than bankfull width in both sections (<40%). Average water depths exceeded 0.20 m in most habitats (Pools and Flats were deeper) and water velocities exceeded 0.25 m/s in most habitats (water velocities were lower in Pools and Flats).

Plate 15: Side channel Riffle-Run complex on the Moberly River, summer 2008.

Plate 16: Pool habitat on the Moberly River, summer 2008.

Pebbles and Gravels represented the majority of bed materials in most habitats in most habitats (Table 3.28). Exceptions included a large percentage of Fines in Flat and Pool habitats of the Lower Section. D90 values were less than 20 cm in all habitats except Rapid. Bed material embeddedness and compaction was moderate (1 to 2) in both sections.

Table 3.28 Bed material characteristics of fish habitats sampled in the Lower and Upper sections of the Moberly River, Site C tributaries juvenile fish summer survey 2008.

Section	Habitat Type	<i>n</i>	D90 (cm)	Bed Material Type (%)				Substrate Condition	
				Fines	PE/GR	CO	BO/BE	Embedd.	Compact.

<sup>a</sup> Includes data from Pool, Run, and Riffle.

The physical and bed material characteristics differed between the Lower Section and Upper Section of the Moberly River (Figure 3.29). Differences included lower bankfull width (25.4 m versus 30.3 m), wetted width (6.9 m versus 11.8 m), water depth (0.22 m versus 0.34 m), water velocity (0.27 m/s versus 0.38 m/s), and D90 (12.7 cm versus 17.3 cm). The percent Fines also was higher in the Lower Section (32%) compared to the Upper Section (16%).

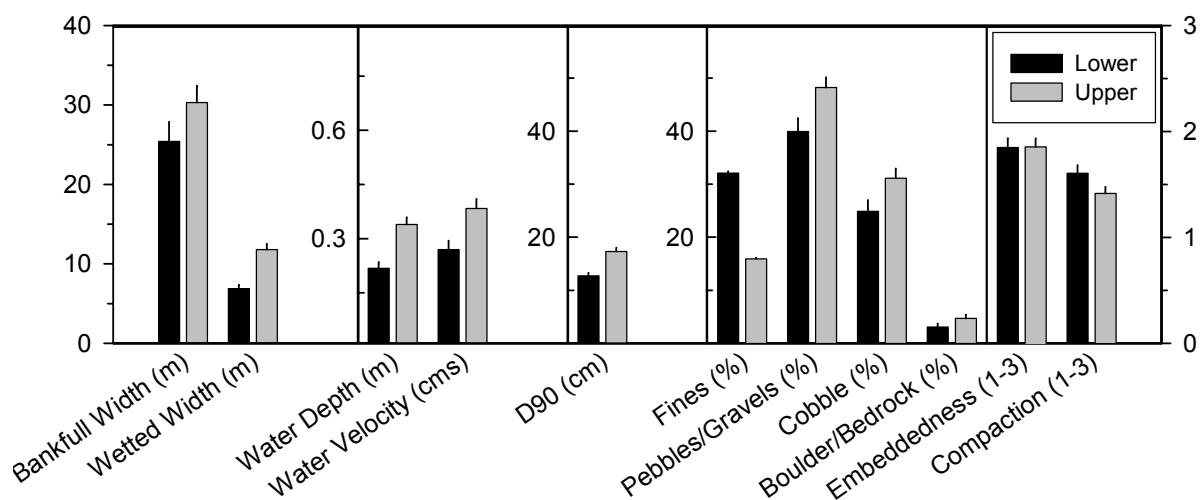

Figure 3.29 Physical and bed material characteristics (mean ± SE) of the Lower and Upper sections of the Moberly River, Site C tributaries juvenile fish summer survey 2008 (includes Pool, Run, and Riffle data).

### 3.8.3 Fish Composition, Relative Abundance and Distribution

#### Species Composition

In total, 1524 fish were recorded during the fish survey on the Moberly River (Table 3.29). The sample consisted of 14 species, which included 3 sportfish, 2 sucker, 6 minnow, and 3 sculpin species. Sportfish accounted for 7.0% of the total sample. Burbot was the most numerous species (3.5%), followed by Arctic grayling (2.4%), and mountain whitefish (1.0%). Suckers accounted for approximately 34.5% of the total sample. Longnose sucker was most important (33.7%) followed by a comparatively low percentage of largescale sucker (0.8%). Minnows were the numerically dominant group (53.4% of the total sample). Longnose dace (30.2%), lake chub (12.1%), and redside shiner (9.9%) were the only minnow species considered abundant. Northern redbelly dace (0.8%) were encountered at one site in the Lower Section of the Moberly River, which was the only record of this species during the study. The sculpin group (prickly sculpin, slimy sculpin, and spoonhead sculpin) accounted for 5.1% of the total sample.

Table 3.29 Fish species composition in the Lower and Upper sections of the Moberly River, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower (n = 7)		Upper (n = 8)		Total

	<i>Subtotal</i>	355	47.8	459	58.8	814	53.4
Sculpins	Prickly sculpin	6	0.8	15	1.9	21	1.4
	Slimy sculpin	10	1.3	46	5.9	56	3.7
	Spoonhead sculpin	1	0.1	0	0	1	0.1
	<i>Subtotal</i>	17	2.3	61	7.8	78	5.1
<b>Total</b>		<b>743</b>	<b>100.0</b>	<b>781</b>	<b>100.0</b>	<b>1524</b>	<b>100.0</b>
<b>Number of Species</b>		<b>14</b>		<b>9</b>		<b>14</b>	

### Distribution

Fourteen species were recorded in the Lower Section compared to only nine species in the Upper Section (Table 3.29). The additional species in the Lower Section included mountain whitefish, northern pikeminnow, northern redbelly dace, peamouth, and spoonhead sculpin.

### Relative Abundance

Some fish species were more abundant in the Lower Section than the Upper Section of the Moberly River (Figure 3.30; Appendix E1). Although catch rates were low for Arctic grayling, there was a large difference between sections (1.6 fish/100 m versus 0.1 fish/100 m, respectively). Longnose sucker catch rates were 14.6 fish/100 m, in the Lower Section and, 9.3 fish/100 m in the Upper Section. Longnose dace catch rates were (14.7 fish/100 m and 10.0 fish/100 m, respectively). Burbot catch rates in each section were low but similar (1.4 fish/100 m), while slimy sculpin were more abundant in the Upper Section compared to the Lower Section (1.9 fish/100 m versus 0.7 fish/100 m, respectively).

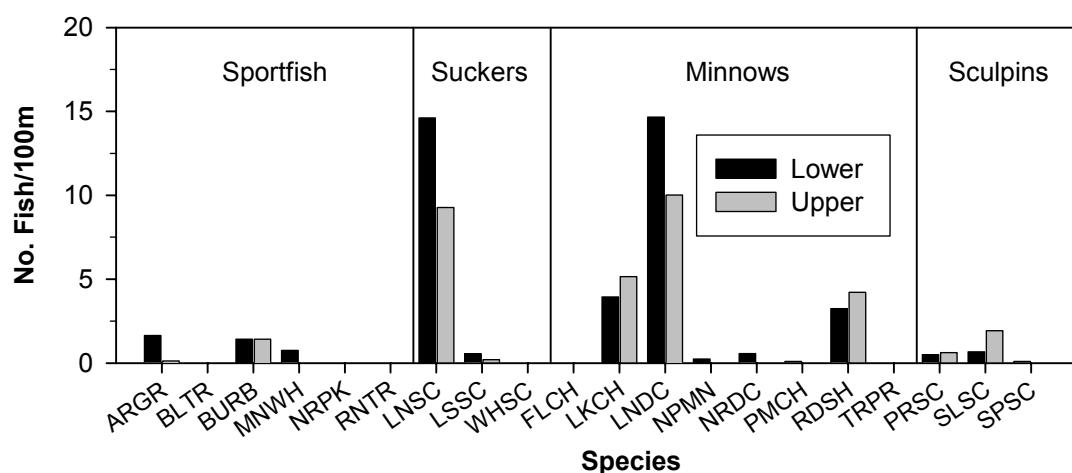

Figure 3.30 Fish catch rates in the Lower and Upper sections of the Moberly River, Site C tributaries juvenile fish summer survey 2008.

### **3.8.4 Fish Biological Characteristics**

The length characteristics of sampled fish from the Moberly River indicated that large-fish species (Arctic grayling, burbot, mountain whitefish, longnose sucker, and largescale sucker) populations were dominated by Age 0 and Age 1 fish (Table 3.30 and Figure 3.31; Appendix F1).

Table 3.30 Length characteristics of fish species sampled from the Lower and Upper sections of the Moberly River, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Lower			Upper		
		No.	Median Length (mm)	Range	No.	Median Length (mm)	Range
Sportfish	Arctic grayling	34	64	53 – 135	3	67	67 – 72
	Burbot	19	144	123 – 203	34	137	107 – 198
	Mountain whitefish	15	55	48 – 68	0		
Suckers	Longnose sucker	46	64.5	24 – 224	52	70	32 – 191
	Largescale sucker	9	75	54 – 247	2	85.5	61 – 110
Minnows	Lake chub	55	58	17 – 103	59	78	34 – 146
	Longnose dace	108	46	17 – 86	80	50.5	22 – 175
	Northern pikeminnow	4	52	48 – 133	0		
	Northern redbelly dace	12	40.5	38 – 47	0		
	Peamouth	2	100.5	92 – 109	0		
	Redside shiner	51	65	32 – 116	65	68	38 – 131
Sculpins	Prickly sculpin	6	68.5	64 – 118	15	61	52 – 145
	Slimy sculpin	10	34	25 – 76	42	64	28 – 88
	Spoonhead sculpin	1	96		0		

Median lengths of Arctic grayling in both sections indicated that samples were dominated by Age 0 fish. Median length of burbot were also similar between sections, most fish were Age 1. Longnose sucker and largescale sucker samples were also dominated by Age 1 fish; however, Age 0 longnose suckers also were encountered.

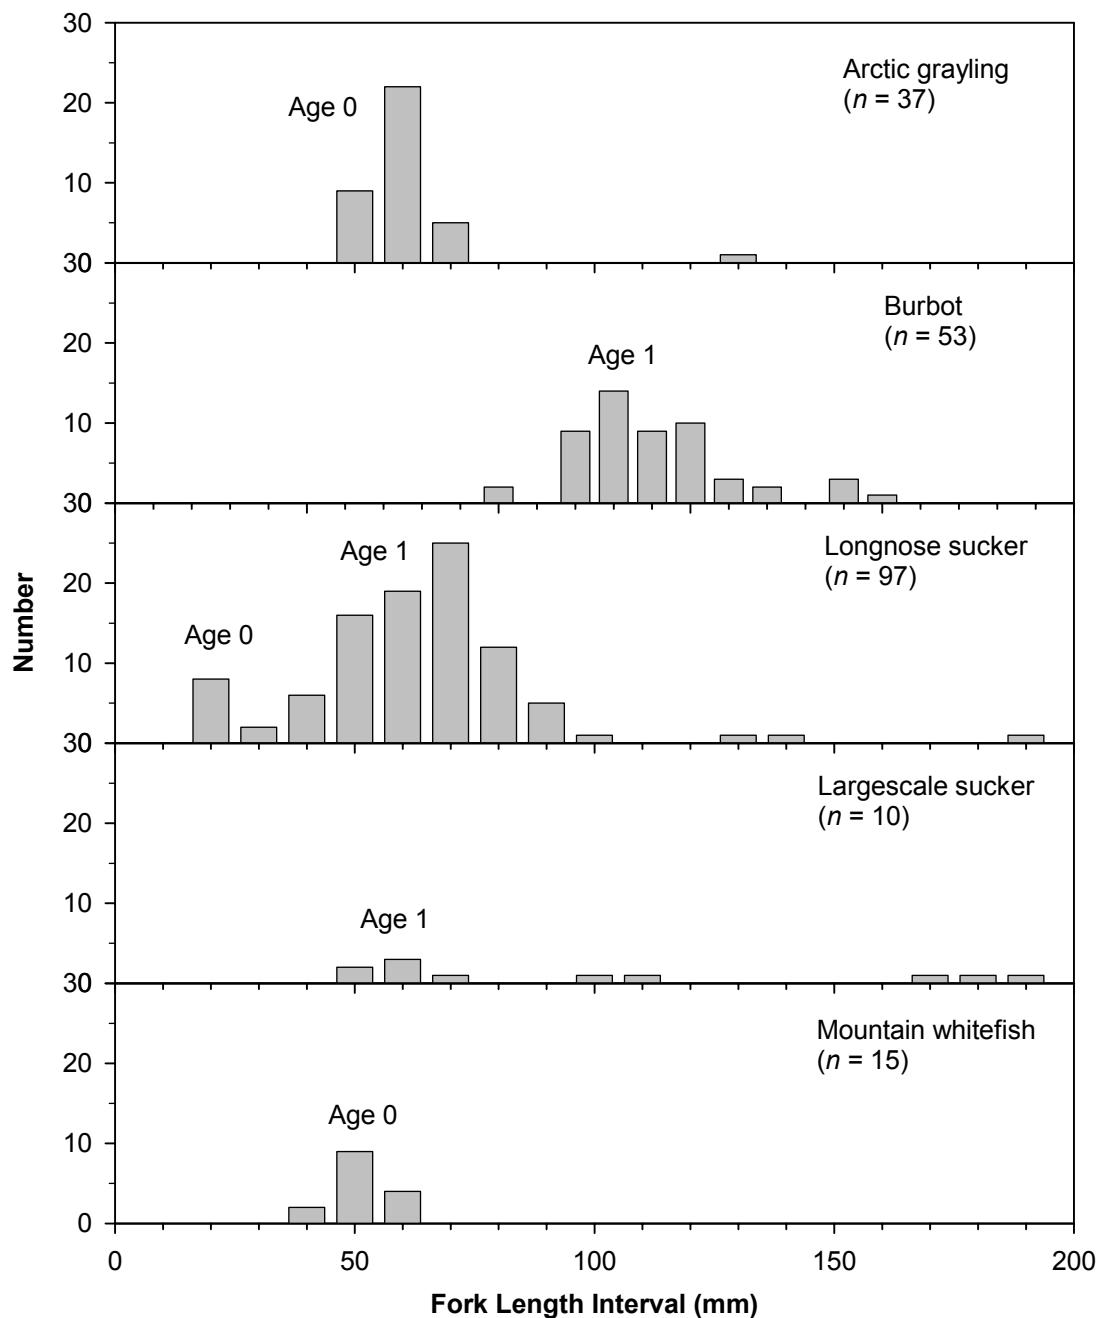

Figure 3.31 Length and age distributions of arctic grayling, burbot, mountain whitefish, longnose sucker, and largescale sucker sampled from the Moberly River, Site C tributaries juvenile fish summer survey 2008 (age designations based on subsample of aged fish and length distributions; data from all sections combined).

## **4.0 DISCUSSION**

### **4.1 ENVIRONMENTAL CHARACTERISTICS**

#### **4.1.1 Water Quality**

Water quality parameters measured during the summer survey (29 July to 7 August) were generally consistent among study tributaries and tributary sections. Water pH in all streams ranged between 7.6 and 9.0, which indicated neutral to slightly alkaline conditions within the range that is considered acceptable for the protection of aquatic life (Anonymous 2006). Water conductivity values in the small tributaries were elevated. Values ranged from 418 µS/cm in Maurice Creek to 2450 µS/cm in Red Creek. There are currently no water quality guidelines for the protection of aquatic life (CCME 2005); however, the high values likely were an indication of groundwater inputs. Lower water conductivities (<310 µS/cm) were recorded on the larger tributaries (Moberly River and Halfway River).

Water clarity was moderate to high during the summer survey. Water was clear in most tributaries in most sections. Exceptions included Lynx Creek, the Upper Section of Cache Creek, and the Halfway River. Clarity on those systems appeared to be influenced by sediment inputs from source streams (Brenot Creek on Lynx Creek), beaver activity (Cache Creek), and highly erodable materials from slumping banks (Halfway River).

It should be noted that pH, conductivity, and water clarity were largely influenced by the low flow conditions at the time of the survey. As such, they do not reflect water quality conditions throughout the entire year.

#### **4.1.2 Water Temperature**

Water temperatures were monitored between May and October 2008. With the exception of Lynx Creek and the Halfway River, most tributaries exhibited a wide range of seasonal water temperatures from a low of 3.4°C (Maurice Creek) to a high of 27.3°C (Farrell Creek). Several tributaries also exhibited a wide range of temperatures within a particular day. Daily temperatures varied by as much as 10.8°C during the warm summer period.

Of note was maximum water temperatures recorded in some tributaries during the study. Water temperatures exceeded the cold-water fish species critical tolerance threshold of 22°C (Oliver and Fidler 2001) in Maurice Creek, Farrell Creek, Cache Creek, and the Moberly River. Although not monitored, high water temperatures likely occurred in Red Creek and Wilder Creek. The frequency of high water

temperatures varied between streams. Temperatures above 22°C were recorded on 6 days in Maurice Creek, 16 days in the Moberly River, 42 days in Cache Creek, and 49 days in Farrell Creek. These conditions exceeded the tolerance levels of cold-water species such as bull trout and rainbow trout, Arctic grayling, and mountain whitefish.

Recorded water temperatures were lower in the Halfway River and Lynx Creek during the monitored period. The water volume of the Halfway River likely had a moderating effect on water temperature in that system. Lynx Creek was a small tributary similar in size to Maurice Creek and Farrell Creek; therefore, lower water temperatures were not expected. Lower water temperatures recorded in this stream may have reflected groundwater inputs and/or shading from the tree canopy and steep valley walls. Visual observations during the program indicated that both factors likely contributed to maintaining lower water temperatures in this tributary.

#### **4.1.3 Discharge**

The discharge regime during 2008 was similar among the small tributaries. A strong freshet was recorded during May, followed by a rapid decrease of discharge to base flow conditions by early summer. Seasonal changes in discharge of the large tributaries was generally similar to that of the smaller systems; however, changes were more gradual and base flow conditions were not reached until later in the summer. All study tributaries exhibited flow patterns that reflected a rapid response to inputs such as snow melt and rainfall events. For example, the spring freshet in the small tributaries exhibited two modal peaks. The first presumably was related to snow melt, while the second was in response to a rain event. The Halfway River, which receives a portion of its flow from the mountains, exhibited a large peak in August after the spring freshet period. This peak likely was caused by a strong rain event in the mountains – it was not recorded in any other surveyed tributary.

#### **4.1.4 Comparisons to Other Studies**

The results of the 2008 program were similar to findings of previous studies. ARL (1991a, 1991b), Pattenden (1992, 1993), Pattenden *et al.* (1990, 1991), and AMEC & LGL (2006, 2007) recorded large seasonal changes in water temperature and/or discharge. Elevated water temperatures were recorded in most tributaries except the Halfway River. Data from the present study and Pattenden *et al.* (1990) indicated that, of the small tributaries, Lynx Creek exhibited the coolest and least variable water temperatures during the summer period. These findings are in contrast to those of AMEC & LGL (2006, 2007), which indicated that Maurice Creek exhibited the coolest and least variable water temperatures during the summer period.

All small tributaries exhibited high discharge during the spring freshet period followed by a rapid decline in flow by early summer. ARL (1991b) also documented a close relationship between rainfall events and stream flows, which is similar to the findings of the present study. Very low flows were recorded in all small tributaries in 2008, which is identical to findings by Pattenden *et al.* (1990) and AMEC & LGL (2006, 2007). In addition, both AMEC & LGL (2006) and ARL (1991a) documented zero flow in Wilder Creek.

The present study documented seasonally variable flow regimes in the larger tributaries (Halfway River and Moberly River). The results again were similar to findings by Pattenden *et al.* (1990), AMEC & LGL (2006, 2007), and ARL (1991a, 1991b).

Pattenden *et al.* (1990) presented information describing general water quality characteristics of sampled tributaries during spring, summer, fall, and winter. Stream pH was neutral to slightly alkaline and conductivity was moderate to high depending on stream and season. Their summer results were very similar to those of the present study. Pattenden *et al.* (1990) documented highly variable water turbidity (measure of water clarity), which tended to be low in summer, fall, and winter and very high in spring. The authors indicated that discharge had a strong influence on this water quality parameter. ARL (1991a, 1991b) also noted very low water clarity of tributaries during the early summer sampling program followed by clear water conditions during fall. The authors attributed this change to a decrease in suspended sediment concentrations caused by low water flow and the absence of sediment inputs from rainfall events. Their findings were consistent with results of the present study and other fisheries investigations completed in spring and fall 2008 (Mainstream 2009a).

## 4.2 FISH HABITAT

Juvenile fish rearing habitats of eight Peace River tributaries were investigated during the 2008 program. In general, sampling occurred upstream and downstream of the Site C reservoir inundation level in order to ascertain whether there were spatial differences in fish habitat. Because fish habitat characteristics were influenced by tributary size, the discussion of the results has been separated into small tributaries, the Moberly River, and the Halfway River.

### 4.2.1 Small Tributaries

#### Overview

Small tributaries investigated during the program were Maurice Creek, Lynx Creek, Farrell Creek, Cache Creek, Red Creek, and Wilder Creek. Discharge conditions of these tributaries were at base flows

at the time of the survey. Three streams (Maurice Creek, Lynx Creek, and Farrell Creek) exhibited good surface water flows. Water flows of Cache Creek and Red Creek were minimal to nil, but standing water was present throughout the surveyed sections. Wilder Creek contained no surface water in its Lower Section, and therefore, was not inventoried. Based on bankfull width, stream size from largest to smallest was as follows -- Farrell Creek, Maurice Creek, Cache Creek, Lynx Creek, and Red Creek.

The percentage of wetted width to bankfull width in all small tributaries was less than 40%, suggesting that these systems were subjected to variable flows and that stream channels, at least at some locations, were laterally unstable. D90 values, an indication of stream power, were greater than 20 cm at most sites, which suggested the potential for high flows.

Results that described wetted stream width, water depth, and water velocity reflected base flow conditions at the time of the survey. Wetted width rarely exceeded 10 m, and maximum water depths rarely exceeded 0.4 m. These characteristics limited the amount (surface area) and quality (water depth) of juvenile rearing habitats in all streams.

Bed materials in most tributaries were dominated by rock substrates; however, bed material size varied between streams. Maurice Creek and Lynx Creek contained high percentages of Cobbles and Boulders, while Pebbles and Gravels were more prevalent in Farrell Creek. Cache Creek and Red Creek also contained rock substrates, but a high percentage of bed materials in these two tributaries consisted of Fines (primarily Sand).

Ratings for embeddedness and compaction provided an index of substrate quality, with higher index values indicating detrimental effects of sedimentation. All surveyed streams exhibited moderate to high ratings for embeddedness and compaction. The results indicated the potential for high sediment loads in all tributaries and that sedimentation reduced substrate quality, conditions that are detrimental to young fish (Newcombe and MacDonald 1991; Anderson *et al.* 1996). There were differences between tributaries. Ratings, from lowest to highest, were Maurice Creek, Farrell Creek, Lynx Creek, Cache Creek, and Red Creek.

The survey consistently identified three dominant juvenile fish habitats in all study tributaries -- Pools, Riffles, and Runs (or Glides). Less frequently encountered habitats were Falls (found only on Maurice Creek), Cascades, and Flats (low velocity Runs). These results suggested a consistent, uniform distribution of juvenile fish habitats (i.e., Riffle-Pool-Run complexes).

One habitat type that was present, but not regularly inventoried during the program, was Beaver Impoundment. Most study tributaries contained active beaver impoundments or evidence of recent beaver activity adjacent to inventoried sites. The only tributary that showed no evidence of beaver activity was Maurice Creek.

#### Section Differences

The survey results indicated that juvenile fish habitats were similar in the Upper Section and Lower Section of each study tributary. The Riffle-Pool-Run complex dominated in each section. Overall, there were no large scale differences of habitat characteristics between sections; however, some were recorded.

Bed materials tended to be smaller and ratings for embeddedness and compaction tended to be higher in upper sections compared to the lower sections in all tributaries. Reasons for these spatial differences were not known. Possible causes included higher sedimentation due to a lower channel gradient or a greater frequency of beaver activity.

#### Comparisons to Other Studies

AMEC & LGL (2006) completed detailed inventories of fish habitats in all study tributaries. Surface water flows were low at the time of that survey and the present study so the results were comparable. The results of the present investigation were generally consistent with the findings of that study. The percentage of bankfull width to wetted width was low, fish habitats consisted primarily of Riffle-Pool-Run complexes, there was an abundance of rock materials, and evidence of sedimentation was widespread.

The present study did not quantify the frequency of fish habitats in sampled sections. AMEC & LGL (2006) suggested that habitat composition varied between streams. Maurice Creek and Lynx Creek were dominated by Riffles with Boulders, Farrell Creek was comprised of a mix of Riffles, Pools, and Runs, while Cache Creek and Red Creek were dominated by Pools.

ARL (1991a, 1991b) completed synoptic surveys of the entire length of each study tributary. Two findings of those surveys should be noted. Firstly, a set of falls is located on Maurice Creek approximately 3 km upstream from the confluence with the Peace River. These falls are impassable to fish, which restricts the amount of juvenile fish rearing habitat available to Peace River fish populations. Secondly, a major tributary of Lynx Creek (Brenot Creek) was contributing significant amounts of sediment to the system at the time of the survey, which adversely affected fish habitat (and rainbow trout

densities) in Lynx Creek downstream of the confluence of these two systems. Sampling by recent studies, including the present investigation, was restricted to sections of Lynx Creek downstream of the Brenot Creek confluence. As such, it is not known whether results accurately describe fish habitat and fish use in the upper portion of Lynx Creek.

#### **4.2.2 Moberly River**

##### Overview

Visual observations of the Moberly River during the 2008 survey indicated the occurrence of a recent flood event. There was evidence of substantial bank erosion, significant amounts of large woody debris, and shifting of the river channel within the valley floor. A review of Water Survey of Canada (Station Station 07FB008) historical discharge data from 1980 to 2008 indicated that a major flood event occurred in June 2007. The peak flow at that time ( $121 \text{ m}^3/\text{s}$ ) was the second highest on record and represented 1.5 times the long-term average for maximum flow. This flood event likely caused changes to juvenile fish habitat.

Discharge of the Moberly River at the time of the summer survey was close to base flow conditions ( $3.5 \text{ m}^3/\text{s}$ ). The percentage of wetted width compared to bankfull width was low, which suggested that the system was subjected to variable flows and that the channel, at least at some locations, was laterally unstable. Wetted width at inventoried sites was approximately 12 m, and water depth was approximately 0.4 m. Bed materials were dominated by rock substrates, primarily Pebbles/Gravels, and Cobbles. Finally, ratings for embeddedness and compaction were moderate to high. The survey consistently identified three dominant juvenile fish habitats -- Pools, Riffles, and Runs. Infrequently encountered habitats were Flats and Rapids. Beaver activity also was observed on the Moberly River; however, the activity was largely restricted to off-channel areas.

##### Section Differences

The survey results indicated that Riffle-Pool-Run complexes dominated in each section, but there were spatial differences in physical characteristics. The Upper Section exhibited a higher percent of wetted width to bankfull width, greater water depths, higher water velocities, and higher D90 values. In addition percent Fines was lower in the Upper Section. Although not quantified by the present study, the results likely reflected spatial differences in the effects of the 2007 flood event.

### Comparisons to Other Studies

AMEC & LGL (2006) completed a detailed inventory of fish habitats in the Moberly River. The authors concluded that fish habitats were fairly homogeneous along the surveyed length of river, which was similar to the findings of the present study. The results of the present investigation were not consistent with findings of the previous study regarding physical characteristics of fish habitats. AMEC & LGL (2006) found only minor differences between the Upper Section and the Lower Section, whereas a number of differences were recorded during the present study. Given that similar methods were used and water flows were similar during each study, a likely reason for the discrepancy would be physical changes to the Moberly River channel caused by the 2007 flood event.

In 1989, ARL (1991a) completed a synoptic survey of Moberly River fish habitats. Their Reach 1 included the Lower and Upper sections of the present study. The authors indicated that the Moberly River channel in this Reach was unstable and braided. Banks were eroding in many places resulting in an abundance of large organic debris. Fish habitats consisted largely of Riffle interspersed with shallow fast Glide (Run). These general characteristics were evident during the present study.

### **4.2.3 Halfway River**

#### Overview

The Halfway River is the largest of the eight study tributaries. Mean daily discharge at the time of the summer survey was  $47.5 \text{ m}^3/\text{s}$ . Because the river channel was not wadeable this necessitated use of a different approach for the habitat inventory. Sampling was restricted to point measures at backpack electrofisher and beach seine fish capture sites.

Unlike the Moberly River, there was no evidence to indicate the occurrence of a recent flood event. A review of historical discharge data from 1984 to 2008 from Water Survey of Canada (Station 07FB006) indicated that the last major flood event occurred in June 2001. The peak flow in 2007 ( $726 \text{ m}^3/\text{s}$ ) was similar to the long term average of  $687 \text{ m}^3/\text{s}$ .

The dominant habitat types recorded in the Halfway River were Runs, Flats (slow Runs), Riffles, and Back Channels. Bed materials in all habitats were dominated by rock substrates, primarily Pebbles/Gravels, and Cobbles. However, Fines (primarily Sands) were abundant in Back Channels and to a lesser extent in Flats. D90 was high (>20 cm) at all sites including Back Channels, indicating that these areas were subjected to high flows. Embeddedness and compaction were moderate to high in all habitats.

### Section Differences

Comparisons of physical characteristics of Run habitats indicated differences between the Upper Section and Lower Section of the Halfway River. The Lower Section exhibited higher water depths and lower water velocities. In addition, D90 was lower, there was a larger percentage of Fines, and embeddedness and compaction were higher in the Lower Section. These findings likely reflected differences in the overall river characteristics (e.g., gradient), as well as sediment inputs to the Lower Section caused by a large slide located at Km 17.

### Comparisons to Other Studies

In 2006, Mainstream (2009b) completed an inventory of the Halfway River using methods identical to those used by the present study. The results of that survey were very similar to those of the present study. AMEC & LGL (2006) completed a detailed inventory of fish habitats in the Halfway River. The physical characteristics of habitats examined during that study, again were very similar to the findings of the present study. The authors indicated that the river was fast-flowing and this condition prevailed in all habitat types. Runs dominated the entire inventoried area, while Riffles and Pools accounted for the remaining habitats. The authors concluded that fish habitats were very similar between the lower and upper reaches of the river.

In 1989, ARL (1991a) completed a synoptic survey of Halfway River fish habitats. Their Reach 1 and Reach 2 generally coincided with the Lower Section and Upper Section, respectively. The authors indicated that Reach 1 exhibited a confined channel, a steady grade averaging 0.2% dominated by Run (Glide) habitat, and Gravel/Cobble substrates. The authors noted a large slide that had blocked the river in summer 1989. This likely is the Km 17 slide identified by the present study, which is still active. Reach 2 was very similar to Reach 1 in terms of gradient, habitat and substrate type. However, the river was less confined by valley walls and contained a larger number of side channels, islands, and shoals.

## **4.3 FISH COMMUNITY**

A primary objective of the study was to determine the species composition, distribution and relative abundance of juvenile fish in areas upstream and downstream of the Site C reservoir inundation level. For the purposes of this study a juvenile fish was defined as any fish less than 200 mm in length, which included younger age-classes of large-fish species and all age-classes of small fish species.

### 4.3.1 Fish Composition, Relative Abundance and Distribution

#### Overview

In total, 20 fish species were recorded in the study tributaries (Table 4.1). There was representation by sportfish (6 species), suckers (3 species), minnows/trout-perch (8 species), and sculpins (3 species). There was a range in the number of species recorded in each tributary, which was generally correlated with stream size. Two species were recorded from Red Creek (smallest tributary), while 18 species were recorded in the Halfway River (largest tributary). Maurice Creek, Lynx Creek, Farrell Creek, and Cache Creek were of similar size and most (all except Maurice Creek) contained between 11 and 12 fish species. Seven species were encountered in Maurice Creek, which reflected the absence of several minnow species. Wilder Creek was not sampled during the summer survey because the Lower Section was dry; however, six species were recorded in this tributary in May during spring sampling (Mainstream 2009a).

Table 4.1 Fish species distribution and relative abundance in study tributaries, Site C tributaries juvenile fish summer survey 2008.

Group	Species	Maurice Creek	Lynx Creek	Farrell Creek	Cache Creek	Red Creek	Moberly River	Halfway River

<b>Number of Species</b>	<b>7</b>	<b>11</b>	<b>12</b>	<b>11</b>	<b>2</b>	<b>14</b>	<b>18</b>	

<sup>a</sup> X denotes most numerous species in the group; **X** denotes most numerous species in the tributary.

Species distribution and abundance varied among streams. Of the sportfish group, Arctic grayling was recorded only in the Moberly River and the Halfway River. Rainbow trout were recorded in four tributaries, but was numerically important only in Maurice Creek, Lynx Creek, and Farrell Creek. It was the dominant species in Maurice Creek. Mountain whitefish were widely distributed (recorded in 6

tributaries), but this species was abundant only in the Halfway River. It should be noted that the scarcity of mountain whitefish in the Moberly River ( $n = 15$ ) may have been an artefact of the fish capture technique (backpack electrofisher), which may not have been effective in this moderate sized stream. Other investigations have recorded large numbers of YOY mountain whitefish dispersing from this tributary in fall (Mainstream 2009a).

Other sportfish species including bull trout, burbot, and northern pike were recorded only in the two large tributaries (Moberly River and/or the Halfway River) and of these neither bull trout nor northern pike were abundant. Tributaries to the upper Halfway River system are important spawning and early rearing areas for bull trout (Baccante 2007); however, the present study area was well downstream of these systems. Burbot were rare in the Halfway River ( $n = 2$ ), but were the dominant sportfish in the Moberly River. This species was not overly abundant at any particular location, but was widely distributed throughout the surveyed area, which suggested that the Moberly River may provide important rearing habitat for burbot.

Longnose sucker was the dominant species in the sucker group. This fish was widespread and numerically abundant in all study tributaries. Largescake sucker was recorded in five study tributaries. This species was abundant in Farrell Creek, Cache Creek, and the Halfway River. White sucker was recorded only in Cache Creek and it was not abundant.

Four of the species in the minnows/trout-perch group were widespread and abundant. These were lake chub, longnose dace, northern pikeminnow, and redside shiner. Lake chub was the numerically dominant species in four tributaries (Lynx Creek, Farrell Creek, Cache Creek, Red Creek), while redside shiner was the dominant fish species in the Halfway River. Longnose dace was the dominant minnow species in Maurice Creek and the Moberly River, and was very abundant in the Halfway River, three tributaries that contained large amounts of Cobble bed material.

Other minnow species such as flathead chub, northern redbelly dace, peamouth, and the trout-perch were not as widely distributed or as abundant as other species in this group. Northern redbelly dace were recorded only in the Moberly River, while trout-perch were recorded only in the Halfway River.

Sculpins were recorded in most study tributaries except Red Creek, but were considered abundant only in Maurice Creek, Moberly River, and Halfway River. Slimy sculpin was the dominant species in these three tributaries, while prickly sculpin dominated in Lynx Creek, Farrell Creek, and Cache Creek.

Spoonhead sculpin was present in four tributaries, but it was scarce in all systems except the Moberly River.

#### Section Differences

The species assemblages were generally similar among Upper and Lower sections of the study tributaries. However, there were spatial differences in the abundance of a particular species within each tributary. In Maurice Creek, rainbow trout were three times as numerous in the Upper Section compared to the Lower Section. In Lynx Creek, the four numerically dominant species (rainbow trout, longnose sucker, lake chub, and longnose dace) exhibited higher catch rates in the Upper Section than in the Lower Section. In Farrell Creek, the opposite trend occurred. Species that preferred Riffle/Run habitats with cleaner rock materials (e.g., rainbow trout, mountain whitefish, longnose sucker, longnose dace, slimy sculpin, and prickly sculpin) were more abundant in the Lower Section compared to the Upper Section. No strong spatial differences in fish abundance were recorded in Cache Creek, Red Creek or Moberly River.

Cold-water sportfish were not evenly distributed in the Halfway River. Species such as bull trout, rainbow trout, and Arctic grayling were recorded only in the Upper Section. In general, catch rates of most species were higher in the Upper Section compared to the Lower Section; however, differences in sampling effectiveness caused by changes in water clarity, may explain the results.

#### Comparisons to other studies

Several investigations have inventoried fish communities in the study tributaries. Surveys completed by Pattenden *et al.* (1990, 1991), ARL (1991a, 1991b), RL&L (2001), P&E (2002), AMEC & LGL (2006, 2007), and Mainstream (2009b) all documented fish use of tributaries in summer. Despite the extended sample period (1989 to 2006) the findings of those investigations were very consistent with the results of the present study in terms of species composition, distribution, and relative abundance. There has been no substantial change in the small fish community that utilizes the study tributaries during the summer period.

An investigation by Mainstream (2009b) in summer 2006 examined fish distribution and abundance in the Upper and Lower sections of the Halfway River. One important finding of that study was the spatial difference in the abundance of mountain whitefish. High densities of Age 0 mountain whitefish were recorded in the Lower Section suggesting that that portion of the Halfway River was an important rearing area. The results of the present study did not identify spatial differences in mountain whitefish abundance. There are two possible explanations for the inconsistency between the two studies. Firstly, the 2009 catch

rates of young mountain whitefish in both Upper and Lower sections were less than those recorded in 2006, which suggests lower recruitment in 2009. Secondly, environmental conditions in 2006 (i.e., record low flow) may have caused downstream dispersal of mountain whitefish into the Lower Section of the Halfway River; these conditions did not occur in 2009. As such, the results likely reflect annual variation in mountain whitefish population dynamics and/or environmental conditions at the time of sampling.

#### **4.3.2 Biological Characteristics**

The present study examined the biological characteristics of younger age classes of large-fish species in order to assess the importance of study tributaries as rearing habitat. Length frequency data in combination with age data from a subsample of fish were used to address this objective.

Age 0 fish and Age 1 sportfish were present in a number of study tributaries. Maurice Creek, Farrell Creek, and Lynx Creek contained Age 0 and Age 1 rainbow trout suggesting that all three tributaries provided rearing habitat for this species. Very high numbers of Age 0 rainbow trout in the Upper Section of Maurice Creek provided strong evidence that this particular area may be important to the Peace River rainbow trout population.

Young Arctic grayling were recorded in the Upper Section of the Halfway River (Age 1) and in the Lower and Upper sections of the Moberly River (Age 0). Because this species spawns and rears in tributaries (ASRD 2005) these results provide evidence that both systems are used by Arctic grayling for these life requisites. Young mountain whitefish were widely distributed, but numbers of fish were low in all small tributaries. The scarcity of young mountain whitefish in the small tributaries was expected because these systems did not provide good quality rearing habitats (AMEC & LGL 2006, present study). Age 0 and Age 1 mountain whitefish were recorded in Upper and Lower sections of the Halfway River and Moberly River. Large numbers of mountain whitefish in spawning condition enter both tributaries in fall (Mainstream 2009a); therefore, it is likely these systems are important early rearing areas. Age 1 burbot were widespread in Upper and Lower Sections of the Moberly River, but were largely absent from other tributaries. Previous studies (AMEC & LGL 2006, 2007) recorded very few burbot during juvenile fish surveys of the Moberly River. The occurrence of substantial numbers of young burbot during the present study suggests that the system may be an important rearing area. It is not known whether these fish represent recruitment from a local population or populations from the Peace River or Moberly Lake.

Young longnose sucker and largescale sucker were abundant and widespread. Age 1 longnose sucker was the dominant life stage recorded in all tributaries except Maurice Creek, and Age 1 largescale sucker were considered abundant in several tributaries. The catch information indicated that these fish were equally abundant in the Upper and Lower sections of most tributaries. Age 0 suckers were not a major component of the catch in any tributary. The results are an artefact of the sample method (i.e., fish were too small to effectively capture); therefore, the results do not properly reflect the abundance of Age 0 suckers in the study tributaries. Information from the present study and other investigations (AMEC & LGL 2006, 2007; Mainstream 2009b) clearly demonstrated the importance of all study tributaries as rearing habitat for suckers.

This page is intentionally blank.

## **5.0 SUMMARY**

The present study described juvenile fish use and habitat characteristics of eight tributaries to the Peace River during summer. The investigation monitored environmental conditions (general water quality, water temperature, and discharge), measured physical characteristics of habitats, and described the small fish community (composition, distribution, and abundance). The study also compared tributary sections located upstream and downstream of the Site C reservoir inundation level. In summary, the objectives of the study were achieved and the results were consistent with findings by previous investigations.

Environmental characteristics of the study tributaries influenced the availability and quality of juvenile fish habitats, and likely was the primary factor that explained the fish community that was recorded in each stream. High summer water temperatures in the small tributaries, Farrell Creek, Cache Creek, Red Creek, and Wilder Creek probably limited use by cold-water fish species such as rainbow trout, bull trout, Arctic grayling, and mountain whitefish. High summer water temperatures were not as severe in Maurice Creek, Lynx Creek, Moberly River, and Halfway River. Discharge in all study tributaries was high in spring, but declined to base flow conditions by summer. The relationship between bankfull width and wetted width suggested highly variable flows. Low flows in all small streams during the study reduced the availability and quantity of juvenile fish habitat. This was particularly evident in Cache Creek and Red Creek (standing water) and Wilder Creek (no surface water). There also was evidence of high sediment loads in all tributaries, which can be detrimental to young fish of all species recorded during the survey.

The physical characteristics of juvenile fish habitats in the study tributaries were influenced primarily by low flow conditions at the time of the survey and relative stream size. For example low flows limited the surface area of the wetted channel (i.e., fish habitat) and small tributaries were more strongly affected than large tributaries. The physical characteristics of fish habitats were generally similar among study tributaries and among sections within tributaries. Habitats were dominated by Riffle-Pool-Run complexes and bed materials were dominated by Pebbles/Gravels and Cobbles. The quality of rock substrates was generally reduced by embeddedness and compaction caused by sedimentation. These characteristics indicated that the tributaries are suitable for juvenile fish use, but the quality of those habitats was not optimal. As stated earlier, environmental conditions such as water temperature, discharge, and sediment load also had a strong influence on juvenile fish use.

Twenty fish species were recorded during the study, which represented four groups that included sportfish, suckers, minnows/trout-perch, and sculpins. In general, the relative importance of a particular species, in terms of numbers recorded, varied among tributaries, but the species assemblage did not vary substantially among sections within a tributary. Notable findings of the study were as follows:

1. Suckers and minnows were the numerically dominant groups in most tributaries.
2. Sculpins were widely distributed in the study tributaries, but substantial numbers were recorded only in Maurice Creek, Moberly River, and Halfway River.
3. Juvenile bull trout did not use the inventoried sections of the study tributaries; other investigations have identified the upper Halfway River system as important bull trout rearing habitat.
4. Maurice Creek, and to a lesser extent Lynx Creek and Farrell Creek, provided habitat for juvenile rainbow trout. The remaining small tributaries did not.
5. Young Arctic grayling were recorded only in the Moberly River and the Halfway River. This was evidence that both systems provided rearing habitat for this species; the small tributaries do not provide Arctic grayling rearing habitat.
6. Substantial numbers of young burbot were recorded in the Moberly River suggesting that the system was important for juvenile burbot. This was a new finding not documented by previous studies.
7. Few young mountain whitefish were recorded in the small tributaries indicating limited use as juvenile habitat; however, the Moberly River and the Halfway River were important rearing areas for this species.

## Appendix – B1A

### Habitat Type Classification System

#### **Instream Habitat** (modified from RL&L Environmental Services Ltd.)

Provides a qualitative assessment of the physical characteristics of a stream and its potential as fish habitat.

**Riffle** - Portion of channel with increased velocity relative to Run and Pool habitat types; broken water surface due to effects of submerged or exposed bed materials; shallow (less than 25 cm). Limited value as habitat for larger juveniles and adults (i.e., feeding), but may be used extensively by young-of-the-year and small juveniles.

RF - Typical riffle habitat type; provides limited cover for all life stages.

RF/BG - Riffle habitat type with abundance of large cobble and boulder substrates. Limited cover for juveniles and adults; but, may be used extensively by young-of-the-year fish.

**Rapids (RA)** - Portion of channel with highest velocity relative to other habitat types. Deep (>25 cm); often formed by channel constriction. Substrate extremely coarse; dominated by large cobble and boulder substrates. Habitat provided for juveniles and adults in pocket eddies associated with substrate.

**Run** - Portion of channel characterized by moderate to high current velocity relative to Pool and Flat habitats; water surface largely unbroken. Potentially high habitat value for all life stages. Can be differentiated into five types based on depth and cover.

R1 - Maximum depth exceeding 1.5 m; average depth 1.0 m. High cover at all flow conditions. Highest quality habitat for larger juveniles and adults; limited value for young-of-the-year-fish.

R2/BG - Maximum depth reaching 1.0 m and generally exceeding 0.75 m; presence of large cobble or boulder substrates in channel. High cover at all flows. Moderate to high quality habitat for larger juveniles and adults.

R2 - Maximum depth reaching 1.0 m and generally exceeding 0.75 m. High cover during most flows, but not during base flows. Moderate quality habitat for juveniles and adults; limited value for young-of-the-year-fish.

R3/BG - Maximum depth of 0.75 m, but averaging <0.50 m; presence of large cobble or boulder substrates in channel. Moderate cover at all flows. Moderate quality habitat for juveniles and adults; but, the value to young-of-the-year-fish is potentially high.

R3 - Maximum depth of 0.75 m, but averaging <0.50 m. Low cover at all flows. Lowest quality habitat for juveniles and adults; but, the value to young-of-the-year-fish is potentially high.

**Flat** - Area of channel characterized by low current velocities (relative to RF and Run cover types); near-laminar (i.e., non-turbulent) flow. Depositional area dominated sand/silt substrates. Differentiated from Pool habitat type by high channel uniformity and lack of direct association with riffle/run complex. Potential habitat value for all life stages is moderate to high. Can be differentiated into five types based on depth and cover.

F1 - Maximum depth exceeding 1.5 m; average depth 1.0 m or greater. High cover at all flows. Highest quality habitat for larger juveniles and adults; limited value for young-of-the-year-fish.

F2/BG - Maximum depth reaching 1.0 m and generally exceeding 0.75 m; presence of large cobble or boulder substrates in channel. High cover at all flows. Moderate to high quality habitat for larger juveniles and adults.

F2 - Maximum depth exceeding 1.0 m; generally exceeding 0.75 m. High cover during most flows, but not during base flows. Moderate quality habitat for juveniles and adults; limited value for young-of-the-year-fish.

F3/BG - Maximum depth of 0.75 m, but averaging <0.50 m; presence of large cobble or boulder substrates in channel. Moderate cover at all flows. Moderate quality habitat for juveniles and adults; but, the value to young-of-the-year-fish is potentially high.

F3 - Maximum depth of 0.75 m, averaging less than 0.50 m. Low cover at all flows. Lowest quality habitat for juveniles and adults; but, the value to young-of-the-year-fish is potentially high.

**Pool** - Discrete portion of channel featuring increased depth and reduced velocity (downstream oriented) relative to Riffle and Run habitat types. Normally featuring Riffle/Run associations. Principal habitat value for all life stages is cover. When in close association with Riffle/Run habitats, value can be very high. Can be differentiated into three types based on depth.

P1 - Maximum depth exceeding 1.5 m; average depth 1.0 m or greater; high cover at all flow conditions. Often intergrades with deep-slow type of R1. Highest quality habitat for larger juveniles and adults; limited value for young-of-the-year-fish.

P2 - Maximum depth reaching or exceeding 1.0 m, generally exceeding 0.75 m. High cover at all but base flows. Moderate quality habitat for juveniles and adults; limited value for young-of-the-year-fish.

P3 - Maximum depth of 0.75 m, averaging <0.50 m. Low instream cover; includes small pocket eddies. Lowest quality habitat for all life stages.

#### Special Features - Includes the following instream features:

**Ledges (LG)** - Areas of bedrock intrusion into the channel; often creates Chutes and Pool habitat.

**Falls (FAL)** - Channel section exhibiting distinct vertical falls over boulder and bedrock. Often a barrier to fish.

**Cascade (CAS)** - Area of channel exhibiting distinct drop over boulder and bedrock, but, no defined falls. Often a barrier to fish.

**Tributary Confluence (TC)** - Area of main river channel directly affected by tributary confluence.

**Snye (SN)** - Well-defined back channel not subjected to mainstem currents.

**Backwater (BW)** - Well-defined zone of zero or reverse flow water velocity associated with a large bank irregularity.

**Bank Habitat** (modified from RL&L Environmental Services Ltd.)

The zone within the immediate hydraulic influence of the bank-water interface. Typically extends from the annual high-water to low-water mark.

**Armoured**

Bank is stable and is composed of armoured cobble to boulder substrates that are not subjected to movement during annual floods; can be differentiated into categories based on the amount of bank roughness.  
(A1 very rough, A2 moderately rough, A3 not rough)

**Canyon**

Bank is stable, is near vertical, and is composed of boulder to bedrock substrates; can be differentiated into categories based on the amount of bank roughness (C1 very rough, C2 moderately rough, C3 not rough).

**Substrate Classification System**

Modified Wentworth classification for substrate particle sizes  
(from Cummins 1962)

Category	Particle Size Range (mm)
Bedrock	-
Boulder	>256
Cobble	32 - 256
Gravel	1 - 32
Sand	0.0625 - 0.2-1
Silt	0.0039-0.0625
Clay	<0.0039
Organics	-

**Depositional**

Bank exhibits low relief and is composed of silt to cobble substrates; characterized by high substrate mobility and low bank roughness (D1 cobble; D2 gravel; D3 sand and silts). Differentiated into tributary (TD) and mainstem (MD) depositional zones.

**Erosional**

Bank is dominated silt to gravel substrates that exhibit evidence of active erosion; note that large rock substrates can be present; can be differentiated into categories based on the amount of bank roughness (E1 very rough, E2 moderately rough, E3 not rough).

## **Appendix – B1B**

### **Definitions**

Wetted width (m):	Width of wetted stream channel at time of survey perpendicular to the direction of flow.
Channel width (m):	Width of rooted stream channel (perennial vegetation to perennial vegetation perpendicular to the direction of flow).
Habitat type:	Classification of habitats into discrete (see Habitat Classification System).
Substrate type (%):	Material forming the bottom of the stream bed (see Substrate Classification System). Visually rated within a predetermined area of stream bed.
D90 (cm):	The diameter of stream bed material which is larger than 90% of the remaining material.
Embeddedness:	Degree that rock substrates are surrounded and/or are covered by sediment (Low, Moderate, High).
Compaction:	Looseness of substrate; ability to be moved during high flow (Low, Moderate, High).
Fish Cover (%):	Instream materials (vegetation, logs, rock) that provide protection for fish within a predetermined area.
Discharge (m <sup>3</sup> /s):	Volume of water flows past a point.
Bankfull width:	Point at which the stream overflows its banks.

**Sex and Maturity Descriptions**

<u>M</u>	<u>F</u>	<u>Class</u>	<u>Description</u>
99		Immature A	Sex indeterminable due to small gonad size.
01	11	Immature B	Small gonad size; fish has never spawned and will not spawn during the coming spawning season.
02	12		Maturing but not ready to spawn; will spawn this year
06	16	Alternate	Small gonad size associated with large size; suggests alternate year spawner.
07	17	Gravid	Sexual organs fill cavity testes white, drops of milt fall with pressure; eggs completely round, some already translucent.
08	18	Ripe	Roe or milt are extruded by slight pressure on the belly.
09	19	Spent	Spawning completed; resorption of residual ovarian tissue is not yet complete.
10	20	External	Sex determined by external characteristics
97		Adult	Based on fish size; sex not determined.
98		Juvenile	Based on fish size; sex not determined.
